Farm Scenes in the Valleys of Oregon

The Valleys and Wheat Fields of Oregon

372
11
no 2

CALIFORNIANS have an interest in our next door neighbor on the north. A rich State with possibilities of great development. And in that development there is in the heart of the true Californian a feeling of heartiest good will and a desire to see our neighbor prosper as we hope to prosper.

Jealousy should have no place on the Pacific Coast. We all have too many opportunities of our own to develop to complain about the other fellow who is spitting on his hands and developing his.

But possibly our busy California farmers may stop a moment and take a look over the fence into our neighbor's backyard and see how big that is.

By the courtesy of Philips Bates of the Pacific Northwest we give, above, a glimpse, and from his paper quote:

"With a length from East to West of approximately 300 miles and an average width of 280, covering four degrees of latitude, Oregon is an empire in itself. Its area of 96,000 square miles is nearly half that of France, and but a small fraction less than that of the entire United Kingdom.

"Were States created according to natural division, Oregon would be divided into three great commonwealths, each rich, but in widely different ways. It will be seen that the Cascade range, running north and south, divides the State into two unequal portions, the larger of which lies to the East of this chain of lofty mountain

"The western portion of the State is further subdivided by another mountain range running parallel with the Cascades and lying between them and the seacoast."

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

The Growing of Bulbs

A Timely Article by O. M. Morris, Who Thoroughly Understands Their Culture Under Pacific Coast Conditions

A FEW simple directions on the culture of bulbs and bulbous rooted plants that are most common in our California gardens. Some of these are naturally very hardy, and grow from year to year without care or attention and produce perfect flowers, while others require the skill of a good gardener to bring them to anything like perfection. Many are evergreen in their growth. That is they never die down, such should be kept watered and in continual growth.

Dutch Bulbs.

There is a general term "Dutch Bulbs," applied to fall bulbs imported from Europe. These are mostly imported by seedsmen and arrive during the fall. Commencing to come in last of August and are mostly all in by October 1. We will class them under four general culture directions as "half hardy," hardy, tender and evergreen.

The tender class such as Cyclamen, Begonias, Ornamental Leafed Caladiums, etc., in which considerable care is necessary to keep bulbs through from season to season. Half hardy as a general rule, are such that require same care and attention as hardy bulbs. All bulbs when not otherwise mentioned should have full open location. They delight in sunshine for a part of the day at least.

Tender Bulbs.

Tender bulbs are those that require some special attention, these bulbs should be lifted as soon as ripened down, placed in the shade and dried off, top then removed, and bulbs cleaned, after which they should be well dusted with sulphur and a few handfuls of coarse ground charcoal mixed among them, then covered with dry sand and stored in cellar or shed till season of planting comes again.

Half Hardy.

These bulbs are those that keep well and are easily handled, except by using some special precautions, under most conditions should be lifted and stored in boxes in dry cellar by covering with dry sand prevents an excess of drying and they will retain more vitality.

Hardy Bulbs.

The hardy are treated same as half hardy, except not necessary to cover with sand but, even with these it helps preserve them.

Agapanthus.

"Blue African Lily," (evergreen) thrives even against abuse and drought, very hardy and a sure bloomer. Will do best if undisturbed for a number of years, often however it becomes too thick and should be divided, fall and winter are best time, tear apart rather than cut them.

Amaryllis, (Hippeastrum).

These all thrive and bloom best if undisturbed. But if moving is necessary as it often is, the best time is after blooming. A. Belladonna, comes in three varieties two of which are common. The Major and Minor, one blooming two months earlier than the other.—Both summer bloomers, will stand transplanting best of the class. A. Johnsoni, A. Vittatum, and Hybrids of this genus, have recently become very popular, all are hardy and easily grown.

Anemone, (wild flower).

The common varieties usually classed with "Dutch Bulbs," should be planted in fall and winter, and as soon as tops die down should be taken up and stored as directed for half hardy bulbs. Anemone Japonica, a perennial grower (evergreen) should be left in its natural growth undisturbed, same as for Agapanthus, blooms nearly all the year.

Antholyza.

A hardy bulb like gladiolus, with exactly same treatment.

Astilbe Japonica, (see under Spirea.)

Begonia, (Tuberous Class.)

These bulbs are mostly imported by seedsmen from Europe, and arrive about Nov. 15 to January 1, and are then ready for planting, should have a shady location, such as would be called a "Fern-bed." Cover bulbs about one-half inch, and water lightly till growth starts. For outside beds, March is best month, but early bulbs could be started in pots and planted out as soon as weather becomes warm. On approach of cold weather they will die down, should then be lifted and cared for as tender bulbs. There are three or four varieties of late introduction that are called "Sun proof," but what is sun proof in England is not necessarily sun proof here. We hope to fully report concerning this for another summer.

Caladiums, "Elephant's Ears."

A semi-aquatic plant, quite hardy if given plenty of water, frequently frosts down, but soon makes new growth. Can be kept growing throughout the year, in most localities in this State. Can be easily divided most any time of year. The ornamental leaf variety does not thrive well in California.

Cannas, "Indian Shot."

A very effective plant for groups and subtropical garden, or border, flowering in great varieties of colors with green and bronze foliage, evergreen in most parts of California and easily divided any time.

Crinum.

Most all of the species are evergreen and treated like Agapanthus.

Crocus.

These are practically a failure in our section and we do not recommend them.

Cyclamen.

Cyclamen are among the most beautiful and interesting of winter and spring flowering bulbs. Are to some extent successful in open ground like Begonias, but for the general grower we recommend them as pot plants. They thrive best in a compost of loam, leaf-mold and sand, to which add a little well rotted manure. Pots and pans should be well drained and bulbs should be planted with crown even with surface of soil. Dormant bulbs can be secured from September to February. (Tender.)

Dahlia.

These most showy plants are of easy culture, requiring a deep rich soil and plenty of water during growing period. There are many selections, double, large flowered, show, pompon, single and

cactus flowered. All should be planted out in April, May and June, about three to four feet apart. At the end of flowering season dry them off and lift the bunches intact, store away in dry cellar or shed till spring when they can be divided and placed in hotbed or frame for propagation, or planted at once where they are to grow. Care should be taken in dividing, as it is necessary to have an "eye" from the stem, the tuber having no eye.

Dielytra Spectabilis, "Bleeding Heart."

A very ornamental flowering plant. Dormant roots are procurable during winter, which should never be allowed to become too dry, plant out early as procurable and when thoroughly dried down, can be taken up and stored in moss, or damp sand till spring. Prefer "fern bed" location.

Freesias.

Freesias should be planted out in fall or as early as July and will flower from January to May, according to time of planting. Can be left for years in same place, but better results come from lifting at least every two years and planting anew. Bulbs should be kept dry till ready to plant. (Hardy.)

Gladiolus, (Sword Lily).

This is probably the most popular bulb grown, admired alike in the rich and the poor man's garden. Always sure to bloom and thrive and is becoming more popular every year. They are remarkable for their grace and beauty and can be planted in California throughout the year. Large bulbs require from two to four months from planting to bloom, according to variety. By planting in January and continuing at intervals of two or three weeks till July, one can have flowers through the whole season. In July by taking up those planted in January, drying them off well, can replant in August and have flowers during winter, try it.

Gladiolus Colvilli, or Dwarf Gladiolus.

There is an early species, the Colvilli, of dwarf habit, seldom growing over two feet, that is grown for early winter and spring flowers, plant in December and January. A handsome new one, "Peach Blossom" has become immensely popular, also a white one of same type.

Gladiolus Seedlings.

Great pleasure can be had by growing these bulbs from seed. By planting seed in protected bed, in early spring and carefully weeding and cared for by September flowers will commence to appear and continue through the season. Often, however, the finest and most delicate colored ones will not bloom till following spring, but the great diversity of coloring and assortments well repays one for the care bestowed.

Gloxinia.

These are only to be grown in green house.

Ranunculus.

One of our finest half-hardy bulbs, should be planted in fall and will bloom in early spring. Thrives best if planted very thick in clumps or beds, say about three or four inches apart each way. Best to take up in early summer and store as half hardy bulbs.

CARBON BISULPHIDE.

THE use of this liquid as an in-
secticide extends back fifty years
and is being used more and more
every year. It was first used in an
It was found that it killed the eggs as
well as the insects, leaving no per-
sistent odor. Experiments under all
conceivable conditions have been
made with the liquid till now it is
used in many ways and its use is
constantly being extended.

As a gopher exterminator it is a
decided success if used during wet
weather while the pores of the soil
are filled with water. Bisulphide of
carbon is a little more than twice as
heavy as air when it has volatilized,
and when it finds any air spaces in
the soil, it will follow them quickly
and before it can reach all the rami-
fications of a gopher's hole for in-
stance, nearly all of it will be lost
and the gopher will escape, when the
soil is dry and open. It is useless to
use it at such times. It has been our
experience that when a gopher hole
runs up and down a hill or slope, it
is useless to try to smother him out
with the bisulphide machine unless
it is worked from the top of the ele-
vation.

After the rainy season has passed,
this material should be laid aside in
the treatment of gophers. The use
of traps is then the only reliable
method of catching gophers aside
from poison. bisulphide is not al-
ways the cheapest method of control-
ling them when there are but a few
scattering ones to get rid of. Where
these pests are in colonies and an
area is infested with them, the bisul-
phide of carbon remedy will clean
out the largest number with the least
amount of work when operated in the
proper season.

In the case of phylloxera it has not
proven desirable in this country,
though it has been used extensively
in France. It costs too much to use
on a large scale for this purpose. For
exterminating this pest in a small
vineyard, it is very satisfactory, but
care must be taken not to use too
much or it will kill the vine. Four
ounces distributed in three or four
holes equally distant around a vine
will do the work. In this case, the
ground should be wet as it will force
a wider and more even distribution
of the vapor. If placed in the dry
soil it may enter an opening of some
sort and most of it drain away before
it does the work. The same is true
in treating woolly aphis on pear and
apple trees.

In the treatment of grubs in the
lawn, very careful work must be done
or the grass will be killed. The lawn
grub goes deeper into the soil during
cold weather than is his habit during
the regular working season. This
period when it is deepest in the soil
is the best time to gas the grub. The
soil is in a more favorable condition
and the grubs are farthest away
from the mass of grass roots. Ants
in a lawn cannot be killed with bisul-
phide of carbon without killing the
grass immediately around the hole.
Boiling water applied often will do
the work without injuring the grass.

When the holes are in open ground,
it is best to make two or three open-
ings with a probe to a depth of six
or eight inches around the ant holes
and pour one or two ounces of the
liquid into each hole. Cover the
holes with dirt and wet the surface.

There is little gained by exploding
the gas after putting it in the holes.
This is often done with the idea of
forcing the fumes down. This is ac-
complished to some degree, but much
of the gas is lost and will continue
to burn with an invisible flame for
some time afterward. It is therefore,
dangerous to apply the liquid again
soon after the hole has been fired,
for an explosion will surely occur. If
left without firing, the gas will grad-
ually work its way down and do the
maximum amount of destruction.

Perhaps the greatest good derived
from the use of bisulphide of carbon is
when it is employed to exterminate
insects in grain bins and seed store-
houses. This is accomplished by
simply placing the liquid in a pan on
top of the piles of seed and closing
the bins or room, if the seed is piled
in such places. There is absolutely
no bad effect on the seed and after
thorough ventilation there is abso-
lutely no odor left.

Ventilation is to be provided for
after use. All openings should be
closed in the floors and lower walls
and the material to be fumigated
should be spread over as much sur-
face as possible. The liquid expands
375 times its volume when it is vap-
orized. When placing the evapora-
tion basins, figure on having one
square foot of surface of liquid to
every 25 square feet of floor surface.
Close every opening in the room but
one, pour out the liquid in the pans
as quickly as possible; get out and
close the last opening. Do this work
Saturday evening before it is neces-
sary to use a light and let the room
remain tight for 24 hours. Two
hours ventilation will make it safe
to work in the building. It is im-
portant that not even an electric
light be used or any electric machin-
ery as the smallest spark will ex-
plode the gas.

Where insects are in seeds con-
tained in sacks, pumping the fumes
into the top of the sack with any of
the bisulphide pumps will kill all
that the fumes come in contact with,
in a few minutes. We have tried it
on onion sets covered with aphis and
one or two strokes into a paper bag,
killing every insect before you could
count ten.

The best way to keep bisulphide of
carbon in small quantities is in glass
jars with screw tops and rubber
bands. Cans in which the liquid is
usually bought, are not air tight af-
ter having been opened. The com-
mon screw tops usually get bruised
when opened the first time. The
liquid is heavier than water and evap-
oration can be entirely cut off in an
open vessel by pouring water on top
where it will float. This method is
neither desirable nor practicable.

ORCHARD IRRIGATION.

Now that the irrigation season is
on, it may be well to call attention
to the fact that trees and plants are
as easily injured by too much water
as by the lack of it. And observa-
tions made by careful or-
chardists, the county horticultural in-
spectors, as well as by the workers
at the Agricultural College, go to show
that more permanent damage is done
to orchards in this State by over-
watering than by any other one
cause. The writer was present at a
fruit growers' meeting several years
ago when this subject was discussed,

and all were unanimously of the
opinion that they could not get along
with less water than they were then
using. But at that very time, land
in that vicinity was becoming seeped,
and the area involved has steadily
become worse.

Subsequent investigations have
shown that the main source of the
surplus water has been from the ex-
cess used by the owners of the land.
This goes to show that it is easy to be
deceived in regard to the condition of
the soil. External appearances will
not suffice, so the careful irrigator
will be continually testing the condi-
tion of his land by digging down
into the subsoil in various portions
of his orchard. It is true that one
man cannot tell another how to ir-
rigate his land, but the cumulative
effect of bad management is soon ap-
parent.

Don't Over Irrigate.

There are many reasons why it is
easy to over irrigate. One of the
most common seems to be that the
average person likes to think he is
getting the worth of his money by
using as much water as possible. It
sometimes happens that there is dan-
ger of a ditch going dry early in the
season. When such a situation arises,
most persons will use as much water
on their orchards as they can get, no
matter whether it is needed or not.

Then there is also the tendency to
let irrigation take the place of culti-
vation, particularly in heavy soils. It
is easier and cheaper simply to let
water run than it is to cultivate. Unless
the ground is stirred at the proper
time after it has been watered, many
soils become hard, and it is difficult
to work them at all.

Soil Mellow If Treated Right.

When properly handled, any soil
which is suitable for orchard pur-
poses is always mellow and easy to
work. But when a soil becomes pud-
dled by over-irrigation and lack of
cultivation, it is difficult to bring it
back to its normal condition.

This subject is one to which too
much thought cannot be given, and
the better orchardists now strive to
use as little water as possible.—[W.
Paddock, Colorado Agricultural Col-
lege.

400 POUNDS WALNUTS PER TREE.

Walnut growers would do well to
visit the ranch of Capt. P. F. Adams,
of Tustin, if they wish to learn what
walnut trees 35 years old will pro-
duce in the way of a crop. Capt.
Adams has many trees that are es-
timated now at from 400 to 500
pounds per tree.

The principal point of interest is in
the extreme age of the trees. It goes
to show that a walnut tree under
proper conditions and care will pro-
duce enormous crops at 35 years of
age. In other words a walnut is not
a transitory proposition.

We may add Capt. Adams has lived
on the ranch for 30 years and the
place is not for sale.

A WALNUT-GROWING COMPANY.

The Willamette Valley English
Walnut Ranch Company has filed ar-
ticles of incorporation with the Sec-
retary of State at Salem. The com-
pany has a capital stock of \$20,000
and will have its local headquarters
at Mt. Angel. It purposes to engage
in the growing and marketing of
English walnuts.—Oregon Agricul-
turist.

General Agriculture

THE CARE OF FARM MACHINERY.

THERE is perhaps no other source of loss so great to the average farmer as that produced by lack of the proper care of farm machinery. As a general rule, the prosperity of a farmer may be estimated by the way he cares for his machinery. Poor care indicates shiftlessness, waste, lack of energy, and that the owner must necessarily buy more tools and implements in a short time. Good care, on the other hand, indicates prosperity, development, bank deposits and the buying of less machinery.

Buy a Hundred Millions' Worth.

The American farmer buys annually \$100,000,000 worth of farm machinery. According to statements made by different manufacturing companies, the farmer would not have to buy over one-half this amount of machinery, providing it received the proper care. A season without shelter detracts more from the value of farm machinery than the wear caused by its use during the same season.

Learn How to Adjust.

Every owner of farm machinery should be able to understand and properly adjust it. Every implement should be looked over carefully before it is used, to see that all bolts are tightened and all moving parts work freely.

Moving parts on new machinery frequently run hard on account of paint in the bearings. This paint can be easily removed by the use of kerosene, or one-half kerosene and one-half machine oil mixed. New machinery should be carefully examined every day, as bolts often work loose, or boxes may fit too tightly, causing them to heat. When the work with a certain machinery has been finished it should be thoroughly cleaned and all parts that are likely to rust should be carefully wiped with an oiled rag or waste. They should then be stored in a shed of some kind, rather than left in the corner of a field or under a tree where the chickens roost on them.

Good Care—Longer Life.

With good care and housing an ordinary grain binder on the average 160-acre grain farm will last from 12 to 16 years. In comparison with this, a binder doing no more work, without extra care or housing, will last but from 5 to 8 years. Records show that many farmers have kept their tools in constant use by good care for more than twice the average life of the machine.

A Few "Figgers."

We will assume that a farmer starts in farming with \$1000 invested in new machinery, and that if sheltered and well cared for it will last ten years, and if not sheltered, only five years. If the implements stand out in the weather it will cost another \$1000 to replace them at the end of five years. The compound interest on this amount for five years at 5 per cent amounts to \$276.28, or the total amount of money paid out for machinery with its interest amounts to \$1,276.28.

A good tool shed large enough for this machinery can be built for \$200. The compound interest on this amount for ten years at 5 per cent. equals \$125, or the shed may be considered to have cost \$325.60 at the end of the ten years. After paying for the shed, it leaves us, at the end of the ten

years, a balance of \$950.68 in favor of housing the machinery and the shed is perhaps good for ten years more use.—H. M. Bainer, Professor of Farm Mechanics, Colorado Agricultural College, Fort Collins, Colorado.

THE LAKE AND THE ASPHALT.

The standard asphalt of the world comes from the Trinidad Pitch Lake, located in the Island of Trinidad, British West Indies. This lake is described by Charles Kingsley, in his nursery literature, as one of the wonders of the world.

The deposit occupies a bowl-shaped depression, probably the center of an extinct volcano. It covers about 114 acres, is nearly circular in outline, and a little less than half a mile in diameter. The center of the lake is about three-quarters of a mile from the shores of the Gulf of Paria, and about 135 feet above the level of the sea.

The surface is hard enough, except in spots in the center, to bear the weight of carts and mules. It is necessary for one to keep moving, however; otherwise he soon sinks in the material, which, under the rays of the hot tropical sun, becomes quite soft.

About 100,000 tons of asphalt are taken out of the lake every year without making any noticeable difference in the quantity that remains. When asphalt is dug from any portion of the deposit, in the course of a few days the hole is again filled up by new material coming from subterranean asphalt springs, as inexhaustible as the water springs that form the Great Lakes of North America. Borings have been made to the depth of several hundred feet, in an unsuccessful effort to find the bottom of the lake. The constant motion of the asphalt made it impossible to go deeper.

The composition of the asphalt is of remarkable uniformity, no matter from what portion of the lake it is taken. Samples taken 135 feet deep at the center do not differ in composition from those taken from the surface a few feet from shore. This shows the uniformity of the whole mass.

The asphalt is in constant motion. There are on the surface of the lake a half dozen or more islands, from fifty to 150 feet in diameter, bearing vegetation, with trees thirty to forty feet high, and a dense undergrowth. These islands move or float about—almost imperceptibly, yet constantly changing their position. From levels which were taken in 1893 and 1894, it appears that the center of the lake is a foot higher than the edges. This is due to the ebullition of the soft asphalt near the center.

The asphalt is dug with picks or mattocks. It is not sticky, like refined asphalt, because of the quantity of water it contains. This water is entirely removed in the process of refining. The crude asphalt is loaded into cars and transferred to ships over a pier 375 feet long.

Trinidad Lake asphalt is recognized by all experts, and especially by the greatest expert. Mr. Clifford Richardson, director of the New York Testing Laboratory, to be the most uniform and best asphaltic product ever discovered. The stability of this asphalt is remarkable. It is practically unaffected by the elements, and, when specially treated and combined with other natural asphalts, is the toughest, most viscous and longest-lived asphalt known. It is not affected by the drying-out process of the air.

This asphalt is used in the manufacture of the Genasco Ready Roofing made by the Barber Asphalt Co., of Philadelphia and San Francisco.

Wherever You Find
A Dollar
You Find a Yankee.

And the Yankee usually connects with the dollar.

Hundreds of Yankees have found the dollar they were looking for on the rich plains of Sunny Southern Alberta, Canada.—They have not only found a dollar but they have found fortunes.

There never was such an opening for the farmer anywhere as is offered on the great irrigated tract of the Canadian Pacific railway in Southern Alberta.

Thousands of farmers are raising good crops in Southern Alberta without the help of irrigation but with its help the results are almost fabulous—Always plenty of water for crops and live stock.

All kinds of grain, root crops, live stock and poultry thrive and produce enormously in this fertile soil when a sufficient supply of moisture is furnished.

In the Canadian Pacific tract there are about 3,000,000 acres, one-half of which will be irrigated when the project is completed.

Thousands of acres are now under irrigation ditches and are being offered for sale at prices so low that every man should have a farm.

In a few years more the low priced land will be gone—settlers are entering the last great west in hundreds and thousands—Prices of farming lands are bound to rise by leaps and bounds and the man who buys now in the right spot is the man who will reap the harvest of dollars.

The right spot is the great irrigated tract of the Canadian Pacific and anyone who takes the trouble to write and find out about it cannot help but acknowledge that the best opportunity for investment in farming lands is here.

We don't ask you to buy until you are thoroughly satisfied—The only way you can be satisfied is to send us your name and address and let us tell you how to visit this favored locality at small expense and see for yourself.

The Cream of Cream Separators

The Sharples Dairy Tubular is the
cream of cream separators—the pick
of the whole bunch. Supply can wait
low, you can fill it with one hand. All
gears enclosed, dirt free, absolutely
self-oiling—no oil holes, no bother—
needs only a spoonful of oil once or
twice a week—uses same oil over and
over. Has twice the skimming force
of any other separator—skins twice as
clean. Holds world's record for clean
skimming.

Bowl so simple you can wash it in 3
minutes—much lighter than others—
easier handled. Bowl hung from a
single frictionless ball bearing—runs
so light you can sit while turning.
Only one Tubular—the Sharples. It's
modern. Others are old style. Every
exclusive Tubular feature an advantage
to you, and fully patented. Every
Tubular thoroughly tested in factory
and sold under unlimited guaranty.
Write immediately for catalog J-250
and ask for free copy of our valuable
book, "Business Dairying."

Live Stock and Dairy

CALIFORNIA DAIRYING.

Continued from Last Week

THE dairymen have come today
to believe the big seven day
test of a cow or even the large
yearly records is after made at the ex-
pense of the cow's vitality. A good
average result over a term of years
makes a safer stock for breeding
purposes. Often these great records
have really little more value to the
dairyman than the records of the
race horse had to do with the ordi-
nary roadsters. It is possible to pro-
duce butter at too great a cost to both
the cow's vitality and of feed. Often
a cow will readily make two pounds
of butter a day for a long period on
a little grain while if fed on con-
ditional foods or oil cakes at a
higher price, she will make eighteen
to twenty pounds of butter in a
week. These extra few pounds of
butter may cost as much for feed to
produce as the first fourteen, and
therefore are not economical.

Choice of Breeding Stock.

Further, the vital energies of the
cow has been sapped. The breeder
of fine cattle that is also a dealer
may once in a while be willing to
sacrifice a cow to build up the reputa-
tion of his stock, but this is not
legitimate dairying as we understand
it, but cattle raising and selling. The
sons of cows that have been forced
for records should be carefully viewed
before purchasing to head herds. If
the dam was a strong, well-balanced
animal the chances are the youngsters
will hand down her qualities, but if
the dam is irregular in form, she is
probably a freak and it is well to
be careful not to pay too high a price
for the son until it is proven that he
will transmit the good qualities he
has inherited.

It requires solidity of type to trans-
mit well. When a type is broken we
find the variations to occur that are
widely apart. It is on these variations
that Mr. Burbank works in the vege-
table world to produce his new flowers
and fruits. Now, if vegetable life
shows so many changes how many
are those of animal life? In the cow
the variations are not in the life of
the cow but in the different offspring.
One son of a great cow may transmit
her qualities perfectly while another
may be worthless. Usually, the
daughters of a great cow are not as
great as the dam but on her sons the
heritage falls heavily, the transmission
going through the sons to the grand-
sons.

Disease.

The stamping out of disease among
cows as lumpy jaw, anthrax,
tuberculosis and Texas fever, are only
a matter of time for the dairyman
who is fully awake to the necessity.
Tuberculosis is most to be dreaded
from its insidious character,
not only as a danger to human life,
but as the dairyman sees it, from the
financial side. It is a serious matter
to see the work of years, the selec-
tion and breeding that has cost
thought and worry wiped out. It hurts
to see the cows go down under the
tuberculin test, for a dairyman feels
his cows to be a part of himself, for,
in a way, he feels he has been able

to create them, and there is nothing
of as great value as that which we
create for ourselves—the joy of self-
expression comes in there.

Testing Cows.

The dairyman must test his cows
and only introduce tested cows into
his herd. The dread of publicity has
kept many dairymen from having
tuberculin used. The fact that it is
news makes every country newspaper
ready to print it. It also makes the
local health officer very important in
his own eyes. The dairymen destroys
the cows he thinks diseased and puts
them under the poppies and says noth-
ing whatever about it. This is now a
thing of the past for the university
has come to the dairyman's aid. The
University says to a group of men that
are interested, to gather together, and
then the University will send a repre-
sentative, from Berkeley, with the tu-
berculin to instruct the dairymen in
the making of the test. The univer-
sity asks in return that these men
will in turn instruct others.

The tuberculin will be furnished
free and the users are required to fill
out the record sheets, returning them
to the university for purposes of mak-
ing statistics. Surely, we will all rush
to grasp this opportunity. I had for
a time the only tested herd in the
State. I found it paid well, for if the
herd is once free it is a simple mat-
ter to keep it so. Cleanliness and
fresh air with abundant food will keep
cows thrifty. Tuberculosis is always
brought into a herd, it is never self
induced. We all know that no wheat
or barley will appear on the land with-
out the seed has fallen there. We all
know as the good book tells us the
seed sown in stony places is lost. The
same is true of the bacilli of tubercu-
losis; make the soil barren by making
the cows healthy and if the tiny bacil-
la is around them it will not take
hold of their system—they are im-
mune.

New Blood.

The common herds in California are
needing the introduction of dairy blood
by the way of the pure-breed sire. It
does not matter which breed is chosen
only after choosing stay by the breed.
Wabbling from breed to breed in ex-
pectation of catching all the good of
each breed and skipping all the un-
desirable qualities is merely the phan-
tasy of a childish brain. The dairy-
man that breeds first one way and then
another way, like other men, he is
punished by his sin not for them.
Eternal vigilance is said to be the
price of liberty and it is also the
price of everything worth having in
this world. Nature will not allow
cross-cuts on her ways. She cares
nothing at all about your aims she
only cares to preserve the species and
therefore favors the physical or lower
side. Milk and butter production are
refinements or brain power in cow and
are easier to breed out than to breed
into the cows. In cattle, always
try to increase the inheritance along
the line desired by using sires strong
in the desirable qualities.

In mixed cattle or grade cows if a
sire no better than themselves is used
the "no account" qualities make up
the greater part of the inheritance.
These naturally crop out strongest. It

The Easy Running, Single Cylinder
Combined Swath and Windrow

CLEAN SWEEP HAY LOADER

The Original Swath and Windrow Machine.
With one simple Racking Cylinder it gets
all the Hay and nothing but the Hay!

Why the Clean Sweep?

Because it will divide a swath.
Because it works well after a tedder.
Because it is the lightest draft loader made.
Because it does not pound or thresh the hay.
Because it does not kick itself to pieces in a
season.
Because it is impossible for its raking cylin-
der to wind.
Because it does not bunch, wad, or tangle
the hay.
Because it is one of the greatest labor-savers
of the century.
Because it handles windrows of reasonable
size perfectly.
Because it does not elevate trash and manure
with the hay.
Because the "Clean Sweep" Carrier can be
raised as the load enlarges.
Because it may be easily detached from the
rack by the men on the load.
Because it works on ground hilly or level,
in windy or calm weather.
Because the "Clean Sweep's" Carrier is readi-
ly removed to make the machine compact
for winter storing.
Because it is simple in construction, light
running, easy to operate, compact and du-
rable.
Because it does not cause you heavy repair
bills.
Because it will pay for itself with the sav-
ings of the first year's use; many times it
will pay for itself in one day in amount of
hay saved which might otherwise be dam-
aged by rain.
Because it goes from light swath to win-
drow work, or vice versa, without any
change in adjustments, the carrying capa-
city of the machine being automatic, and is
regulated entirely by the hay itself.
Because nothing but high-grade material and
workmanship are used in its construction.

is survival of the worthless. With a few crosses of good blood in a little time the cows become of a type and can be handled as one. Go out and look at your herd and if there is not a distinct type running through it, then you have been at sea in breeding. Today, I can often tell from the train window the offspring of my cattle even in the third generation. They have the stamp I placed on them by selection of their ancestors. This is the art of cattle-raising and art has been defined as the beautiful way of doing things. A uniform herd is a beautiful one.

Immature Stock.

Breeding too young and weakening the constitution is a further fault that is eating into the vigor of our registered herds. So universal has this custom become in a short sighted policy to increase the number of calves, not the quality, that I can only hope that some day the cattle association will refuse to register the calves from immature cows.—M. E. SHERMAN.

WAGING WARFARE NOW.

The dairy interests of the country will probably have to defend their position before the next Congress. The oleo interests are pointing to the present high prices of butter and claiming that the blow given the oleo business by the 10-cent federal tax is mainly responsible. These views they will probably take to Congress next year. The butter men explain and justify the high butter prices on other grounds; nevertheless, it is for them an unfortunate coincidence that butter has ruled high ever since the enactment of the federal law.

The 10-cent tax law unquestionably struck the oleo industry a staggering blow. The oleo output for the year ending June 30, 1902, was 126,316,000, while for the year ending June 30, 1906, it was only 53,146,659 pounds, a shrinkage of over 50 per cent in four years! Much of this business has unquestionably gone to butter, because there is nowhere else it could go. And that this has at least had some share in holding up prices cannot be denied.

Nevertheless, the consuming public should be willing to pay even more than this for practical immunity from oleo.—The Grocery World.

RESULTS OF OFFICIAL TESTS OF JERSEY COWS.

It is now just four years since the American Jersey Cattle Club promulgated its rules in regard to records of performance entitling cows to entry in the Register of Merit. To May 1, 1907, one hundred and fifty-nine fat tests for one year have been completed and reported; also, seventy-four fat tests for seven days and forty-eight confirmed butter-tests for seven days are on record. In the case of these butter-tests, the records of churned butter are verified by Babcock tests of the milk. The results of these tests for one year show that the average amount given to the two-year-olds was 5882 pounds of 5.413 per cent milk. Cows under two and one-half years, 29 tests being made, 6517 pounds of 5.39 per cent milk. Cows under three years, 24 tests, 7138 of 5.365 per cent milk. Cows under three and one-half years, 30 tests, 7516 pounds of 5.299 per cent. Cows under four, 9 tests, 7379 pounds of 5.432 per cent milk. Cows under four and one-half, 13 tests, 7846 pounds of 5.578 milk. Cows over five years, 33 tests, 9228 pounds of 5.334 per cent milk.

The average of all cows (159 tests) was 7639 pounds of 5.364 per cent milk.

THE KIND OF A COW.

A cow that will produce 300 pounds of butter fat in a year is a good one. Some farmers are boarding cows that do not produce half of that. But some farmers demand at least 400 pounds and get it. There are some also who get 500, 600 and over 700 pounds a year. It is only the same work to feed a 700-pound cow as to feed a 200-pound critter. Which is better?—N. W. Agriculturist.

Milk may be poisoned through bad air drawn into the lungs of a cow, as the bad odor will affect it in the pail after being drawn from the cow.

Rustling for a living may make hardy stock, but it makes small milk checks.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Last but not least be sure and have a supply of pure cool water.

APPELL'S SOUTH AFRICAN WATER BAG

(PATENT APPLIED FOR)

Will supply a cool, refreshing drink, wherever you go—on business or on pleasure bent. It keeps water cool 48 hours or longer; in sun or shade; no ice; light and convenient to carry. It is a welcome convenience to prospectors, surveyors, travelers, sportsmen, miners, rangers, stockmen, farmers, timbermen, threshing crews, millmen, railroad men, teamsters, boatmen and everyone exposed to dry, warm weather where good water supply is uncertain. Can be hung on pack, saddle, vehicle, implement, on a tree, or laid on the ground. It will keep the water cool under all conditions, provided the bag is exposed to the air. Satisfaction guaranteed or money back.

The Ornamental Garden

BULBS.

BULBS do not receive the atten-
tion that their beauty justifies.

Many have no use for them, more
have them in the garden where they
receive indifferent or no attention
and their fullest beauty is not de-
veloped. A great many of the more
hardy ones are easily cared for and
give magnificent returns. We have
seen a bed of seedling gladiolus or
amarillis which brought in the neigh-
bors to stand in admiration.

We hope Mr. Morris's article, which
appears on first page of this issue,
will attract attention to these
beauties which may be added to our
gardens and more of them may be
planted.

DAHLIA.

Dahlias are the most perfect sum-
mer blooming plant that I have in my
collection, and the admiration of all
who see them.

Secure the bulbs in February and

to those who would plant it for prof-
it, is that at least 75 per cent of the
seedlings are barren, some of them do
not bloom at all, and of the remain-
ing 25 per cent, some bear fruit with
so little meat covering the large seed
that they are of little value. These
different seedlings (the writer knows
of no budded or grafted trees,) bear
fruit differing in size and shape, the
meat varying in thickness from a
quarter of an inch to an inch. The
shape is of no value, but the edible
part is. A deep sandy loam soil
seems to produce the most luxuriant
growth, but the trees that have pro-
duced the most fruit are growing on
heavy clay soils; yet this productive-
ness may not be due to soil, but
the nature of the tree. It will stand
eight degrees of frost without injury,
and requires plenty of water during
the summer for its best development.
In our fertile soils the question of
manure is not yet considered. So
far as a money-maker is concerned,

Calla Lilies

plant in boxes until growth begins,
then set in rich soil where the sun
gets to them all the day, and keep
well watered and the bloom will be
grand from middle of April to Au-
gust, and such variety and style that
they attract all flower loving people
that see them.

The style and form are in great
variety, from pure white to deep
red and mottled, and from single to
full double, variegated mottled pink
of the richest color. The dahlia
revels in the hot sun and the bloom
is so abundant that one may cut
flowers every day for three months.
A dozen bulbs will give more satis-
faction than any other one variety
of plant in my knowledge.

Besides growing them from tubers,
which are expensive, the single vari-
eties are easily grown from seed
sown in boxes early in spring. The
double varieties, are also easily grown
from seed, but the result is much
more uncertain. That is, the seed-
lings are quite liable to be only semi-
double and of little value for culti-
vation.—Florida, Agriculturist.

THE ALIGATOR PEAR.

Some facts relative to Persea gra-
tissima, aligator pear, that have come
under my observation during the two
years past may be of interest to
your readers. It is the most delicious
of all the fruit grown in this part of
the country, and retails in our mar-
kets at fabulous prices—\$3 to \$9 per
dozen fruit. One tree near Los An-
geles produced \$137 worth last year.
One fact, and a most important one

it beats walnut orchards and orange
and lemon groves—the staple pro-
ductions of Southern California—16
to 1, but planters must bear in mind
that stock propagated from fruiting
trees is the only kind that will pay
for the time and expense necessary
to bring an orchard into bearing.
The seed germinates better in soil
than it does suspended in water—a
method one occasionally sees prac-
ticed in green-house establishments.
The writer is experimenting with ripe
wood cuttings under glass. No in-
sect pest or disease has yet affected
any trees growing here, and there
are some large ones. The largest one
never blooms.—P. D. Barnhart in
Florists Exchange.

POISON IN FLOWERS.

Beautiful as flowers appear to the
eye, there lurks behind their attrac-
tiveness certain death. They may
be handled with impunity and their
odors enjoyed without any danger,
but let any one taste the juice of
some of the sweetest and with every
drop he is taking deadly poison into
his system. Even the bulbs of such
dainty flowers as the Snowdrop, Nar-
cissus, Hyacinth and the Jonquil are
poisonous.

The Oxalis also is not a safe thing
to put between the lips, and all the
Lobelias will produce dizziness and
general disease. The Monk's Hood
and the beautiful Foxglove are nox-
ious affairs, from which powerful
drugs are obtained, more than a few
drops of their extracts being usually
a fatal dose.

Certain of the Crocuses if eaten,
even if nothing is swallowed but the
juice, produce vomiting. The bulb
of the intricately beautiful Lady's
Slipper poisons externally as the
noxious Ivy, Dogwood and Sumac.
The quaint old Jack-in-the-pulpit, al-
though not a garden plant, is another
enemy to health and life, and so also
is the marvelous Queen Anne's Lace,
which now and then will creep in
through the paling and looks so en-
chanting when far and wide it em-
broiders field and roadside.

The laughing little Buttercup, that
might be a drop of visible sunlight,
is by no means as innocent as it
looks. The cow in the pasture knows
enough to avoid it. That and all its
cousins, the rich, profuse Peonies,
the dazzling blue Larkspurs and the
rest are full of toxic properties.

The oleander tree that is set out-
doors when spring comes and that
lines the streets of various of our
Southern cities, is another hive of
deadly poison.

The superb Catalpa tree, towering
with its great leaves and its masses
of white and fragrant flowers, is a
charming thing in the garden, but
its bark is exceedingly injurious, and
the Laburnum, that looks like a
fountain of gold leaping into the sun,
is poison in leaf and flower and seed,
and even the grass beneath it is best
thrown away when cut instead of be-
ing fed to cattle.—Exchange.

"THE BEST I KNOW OF."

The Cultivator is always glad—or
rather it appreciates it as a kindness
—when a subscriber writes in and
criticizes its failings. We like to
make the effort to make the paper
come up to the requirements of every
subscriber. So send in your criticisms.

Likewise, very often subscribers
send in commendation of our good
points. It's appreciated, but not so
necessary as that we shall be re-
minded of our failings.

In the class who see the good
points is F. McClellan of Hanford,
who writes:

"The Cultivator is the best farm
paper I know of and I hope it will
continue as good in the future as it
has been in the past."

GROWING FALL POTATOES AND FERTILIZER FOR THEM.

A SUBSCRIBER writes for information as to soil, plowing, irrigating, etc., for fall crops of potatoes and also as to fertilizer for crops on light, sandy soil. The question has been referred to Mr. Q. A. Lobingier of the San Gabriel Co., who answers:

Good Soil and Plenty of Moisture.

In attempting to grow a fall crop of potatoes in California it must be borne in mind that the crop has to be grown during the most trying atmospheric conditions we have, and it is therefore essential that care is had in the selection of suitable soil. Avoid heavy, compact soil, such as bake after irrigation. As a rule, adobe soil is not well suited for potatoes. Having selected suitable soil, if it is not moist enough it will be necessary to irrigate it thoroughly before plowing. In well-drained mellow soil, there is not much danger of getting too much water into it before beginning operations. After you are sure the land has been well dampened, the preparations for planting is pretty much like that which is found anywhere the world over—thorough plowing and harrowing so as to make a good seed bed for the crop. Almost every locality has its detailed method of planting and each one can follow that best suited to his local conditions.

How John Does It.

While the Chinese are not always a model to follow as to methods, sometimes we find them pursuing ways that are both expeditious and effective. They use a single shovel-plow to furrow out the ground, making the furrows about two and a half feet apart, the cut potatoes are dropped in these furrows about 10 or 12 inches apart and covered by going between the rows with this same shovel plow, and following that with a common planter—this does not altogether obliterate the furrows so that very little work is needed to prepare the ground for irrigation, when the plants need it.

Irrigation.

I can lay down no better rule as to the number of irrigations than to say water should be given as often as is needed to keep the ground in fair condition—the crop will not grow well if allowed to get too dry, nor any better if kept too wet—the character of soil, the locality, thoroughness in cultivating are all factors that help determine the question of irrigation.

Varieties.

As to varieties, I think any of our Los Angeles seedsmen could give a better answer than the writer. If new crop seed is used be sure that it has been well ripened.

Time of Planting.

As to the time to plant for a fall crop, it is difficult to name a date that will apply equally well to every locality. In localities that are nearly free from frost the time of planting can be safely delayed longer than where early frosts occur. In this locality I should wish to plant not later than the second week in August—two weeks earlier would be safer.

To Prevent Scab.

Dissolve two and one-fourth ounces

corrosive sublimate in two gallons of hot water and then add water enough to make it 15 gallons. Wash your potatoes clean and soak them in this mixture one and one-half hours. Do not cut your potatoes until after they have been put through the sublimate and remember they are deadly poison to all animal life and must be carefully handled and all of them planted. In many localities it is not possible to grow a good crop without spraying with Bordeaux mixture as a remedy against blight. This can now be purchased from many of the seedsmen in a condensed form.

I would add that potato growing in California is a very uncertain matter in the hands of the careless or inexperienced and there is possibly more money lost in attempting it than in anything I now think of except the poultry business. But like the latter, with right conditions and careful, intelligent work, it will compare favorably with any other line of horticultural work.

Fertilizer.

Relative to fertilizer for potatoes on light, sandy soil I should use pure ground bone and sulphate of potash. Sow them broadcast over the soil after plowing and before harrowing. Use 1000 pounds of bone and 200 pounds of potash per acre. If these fertilizers are very dry and dusty it will not injure them to dampen them; if they are used at once and it is not an unpleasant job. I use practically the same method followed by the concrete men in dampening their concrete. Empty your fertilizer on clean hard ground and let one man apply water from the hose while another turns the pile over with a shovel; only sufficient water should be used to thoroughly dampen it. It must not be allowed to lie over a few hours in a pile (I refer now to the bone) or it will heat violently and much of the ammonia will be lost. If the potash is in hard lumps the water will soften it and it can be run through a screen and thus put in proper condition for sowing. I prefer to sow these fertilizers separately not because they would be injured by mixing, but it is easier to make the proper distribution over the surface than to do the same by mixing.—Q. A. L.

TO KILL RABBITS.

Mr. Ostergard, of Glendale, gives us the following, which he assures us will destroy rabbits to perfection:

"Rabbits and vines may be said not to go together, yet the fact is that they sometimes go too well together. To prevent this there is but one way to effectually save the vines. Dissolve a small vial of strychnine crystals in the juice of an ordinary lemon after first having powdered the crystals. When fully dissolved add water enough to make a half a pint. With a medicine dropper (cost 5 cents.) drop a drop on the tender leaves. Vinegar is as good a solvent as water, but it burns the vine where it touches, but the solution made by it has the advantage of keeping for a long time which is not the case with that made from lemons. It must be used while fresh, but has the advantage of not burning the leaves. Take your choice.

Riverside has a navel orange which weighs two pounds.

CABBAGE WORMS.

There are three kinds of worms that feed on the cabbage. The most common is the imported cabbage worm, another is the zebra caterpillar, and the third is the plusia. The imported cabbage worm is the most destructive of all three varieties. It is green in color, larger in its middle part and tapering at both ends.

The zebra caterpillar is a very brilliant worm whose body is marked with stripes of yellow and black. At first the worm is quite dark, but as it grows older it becomes lighter in color. When it is full grown, it is about two inches in length. When the plant is disturbed they roll up and drop to the ground.

The plusia is a pale-green worm. The color is striped, one stripe being quite light, while the next one will be a shade darker. The head is small and the body becomes larger as it approaches the rear end.

The same remedy will be effective for exterminating any of the three worms. However, it will need to be stronger for the plusia than for the others. Pyrethum, either the powder or the Buhach, is advised by a great many. For the imported worm, or the zebra caterpillar, six parts flour to one part of the powder should be thoroughly dusted on the plant. In fighting the plusia, use only three parts flour to one part pyrethum.

Another simple remedy, and one that has many friends, is the application of road dust. We know of several reliable gardeners who use this remedy, and we have every reason to believe that it does all they claim for it. The application must be thorough, so that all parts of the cabbage leaves and head are covered. Perhaps the most simple of all remedies is the use of boiling water. Put the water, boiling hot, in the watering can and pour it on the cabbage, allowing it to run down, over and between the leaves. It will not injure the cabbage, but is death to every worm with which it comes in contact.

NURSERYMEN'S CONVENTION.

We are in receipt from President Power of the full program of the Pacific Coast Nurserymen's Convention to be held at the same time as the Salem Cherry Fair, at Salem, Oregon, July 10-12. It is packed full of good things from a nurseryman's standpoint. Many speakers are from California and others are from Washington and Oregon.

HOW MUCH TO PLANT.

One pound of beans will plant a fifty-foot drill. One ounce of beet seed will sow fifty feet. An ounce of cabbage seed will make 2000 plants. One pound of corn will give 150 hills. An ounce of cucumber seed will make enough for 100 hills. One ounce of lettuce seed will give 5000 plants. An ounce of watermelon seed will be enough for thirty hills. A pound of onions sets will be enough for a 75-foot drill. One ounce of tomato seed should give 3000 plants.

MARYSVILLE AFTER WHITE FLY.

THE cutting of the foliage of the White Fly infested trees progressed yesterday, great bunches of orange tree tops could be seen in the streets in front of many prominent residences, later to be hauled off to the crematory to be burned, says the Marysville Appeal. The city authorities have now taken a hand in the matter by announcing that all brush from the orange trees placed in the streets would be promptly carted away by city employees at no expense to the property owners.

One of the first orders received by H. P. Galligan, proprietor of the Pavilion stable, who is an experienced pruner and who has gone into the business of taking contracts to properly defoliate orange trees, was from Mayor Hall. The Mayor says his trees really need the treatment as he intends to make over his rather extensive orange grove to standard navel trees. It begins to look as though the majority of property owners now realize that it is really the proper thing to do to observe the State law, as laid down in the notices now being served by Constable Tyrrell; yet there is a minority of good folks who have not as yet "got wise" to the fact that Marysville, being the only place in the State where the white fly exists, can not afford to have it appear that she is harboring a pest that may actually ruin the citrus industry of the State; this minority still howling over the prospect of being compelled to go to work and clean up their trees have finally decided to fight, but they are mighty crafty about their fighting; they are going to give their case to an attorney on a contingent; if he wins, so much; no win, no pay.

Horticultural Commissioners Harney and Reed held a meeting yesterday and afterward announced that the law would surely be enforced. G. W. Harney said the commission would proceed strictly in accordance with the law as interpreted by the district attorney, and those who are promptly defoliating their trees could be assured that all would be treated alike. The State Commissioner has the right to say how the trees shall be treated; the law has been tried out many times in State and Supreme courts. Stirred up by the appearance of the white fly here, commissioners throughout the State now realize that the whole State has been too lax in the treatment of insect pests on orange and other fruit trees, and a new campaign is on for the destruction of all injurious insect pests.

Objections in Marysville are not well taken and will be overruled. The commissioners do not fear any injunctions and work will be pushed as rapidly as possible.

INTEREST IN IRRIGATION CONGRESS.

In all sections of the West a lively interest is being aroused in the coming interstate exposition of irrigated land products and forestry products, to be held in Sacramento in September in connection with the fifteenth session of the National Irrigation Congress. All those eligible to enter the numerous competitive displays for costly and handsome trophies hung up by the management of the exposition, are arranging for an adequate exhibit of fruits, cereals, vegetables and other products of irrigated land and forestry products in the several departments of the exposition. Inquiries are

pouring in at headquarters from many States for information and particulars concerning conditions and terms of the contest. That the display will exceed in magnitude and importance all previous attempts in that direction, is a foregone conclusion. The keen interest shown by those most vitally concerned leaves no doubt upon the subject.

Among the first to apply for space and facilities for a State display in the intersate exposition is Utah. The Legislature last winter appropriated \$4000 to cover expense of having Utah properly represented in the exposition, and no stone is being left unturned to have the wishes of that body carried out to the letter.—[Sacramento Union.

VALUE OF PLANT INTRODUCTION GARDEN.

At the National Plant Introduction Garden at Chico to date there have been 5200 varieties of plant and tree growth received at the garden, and these come from every corner of the globe, where special agents of the Department of Agriculture can reach. In alfalfa fifty-five varieties have been received, and are now under propagation at the garden. Of clovers there have been received between eighty and ninety varieties. The Japanese matting grass plants, the obtaining of which brought so much trouble to Special Agent Tull, have been planted in the open, and will be retained until next winter, when they will be transshipped to other parts of the United States, particularly Texas and the Carolinas.

An important experiment is being carried on with African para grass, and this may prove in time to be of the greatest benefit to certain sections of California. This grass is raised in some sections in preference to alfalfa, and being a much harder growth, has proven profitable. It is especially adapted to overflow sections, and in this particular may prove of value to California. Sulla grass, from the European countries, and a rival of alfalfa, is also being experimented with.

A surprising result has been obtained from a Chinese cherry. A scion was sent to the Chico garden by Explorer Frank Myers, from China, and it was grafted on another cherry tree. Long before there was any sign of fruit on the original tree this branch bore fruit, and thus afforded the first ripe cherries in California. In the line of sorghums, 380 varieties have been received, but of these only twenty-five have been used, so radical are the selections. These are doing well, and good results are looked for.

NUMBER EIGHT FARMER MAKES A DISCOVERY.

A farmer in No. 8 district has made a discovery that will be of vast importance to the other farmers of that section during the time they are without a water supply. He has found that by planting onions and potatoes in the same field and alternate rows, the onions being strong, bring tears to the eyes of the potatoes in such volumes that the roots of the vines are kept moist and a big crop of both vegetables raised.—[Holtville Tribune.

Bee stings, mosquito or gnat bites may all be relieved by bathing in borax water.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

With the Citrus Growers

ACIDULATED PHOSPHATE.
THERE has been some discussion recently as to the advisability of using acidulated phosphate on our orange groves. We were given the credit, unintentionally, of saying that it was injurious to use this form of phosphate.

We have never had any such idea as we have never seen any evidence that would lead us to believe that it was injurious. We have a set of experiments in which green-manuring crops are grown on plots where acidulated bone is drilled in before the seed; and on adjoining plots are growing the same green crops without any phosphate. The nodules were just as abundant on the roots of the vetch and cowpeas growing on the acidulated bone plot as they were on the plots having no phosphate. We also have the same with acidulated rock and without phosphate. In all cases there is an abundance of the nodules on the roots. As far as can be detected, there is no difference in the appearance of the trees on the different plots.

The lemon growers of San Dimas grew much concerned over the report that leading citrus growers have found that acidulated goods were injurious to their trees. Mr. Mills of the Arlington Heights Fruit Company, has made a striking record of improving a large acreage or "run down" citrus groves. He has done it with fertilizers, including acidulated bone and rock and acidulated guano in conjunction with green-manuring crops. He tells us that he has this year used over one hundred tons of acidulated goods and will continue to use them. He claims that after using them for a number of years, he gets results so satisfactory that he can't afford to stop using them. Mr. Mills says he used about 150 tons this year on his groves and shall continue to use them. Until we know of some specific cases where acidulated phosphates have injured citrus trees, we will continue to think they are proper and safe to use. The cases referred to above are quite convincing that we need have no fear of acidulated phosphates.

A COMPLETE IRRIGATING SYSTEM.

The Citrus Experimental Station at Riverside, has just completed a very satisfactory irrigating system. The experiment grove lies on a slope of land that has a fall of about four inches to 20 feet. There are 20 plots in the main plantation, in each of which are 36 trees including a check row at the upper end of each plot. The plots are laid off with the idea of making fertilizer tests and the water system is so arranged that it does not flow from one plot to another. Each plot has a standpipe at the highest point. Two furrows are led out from this. The plots are but four trees wide and the irrigation furrows are made on the level, the only fall being at the turns made toward the lower furrows. This has proven to work satisfactorily. At the lower end of each plot the waste water, if any gets away, irrigates the check row at the upper end of the adjoining plot and is carried down to the side of the plantation where it drops into a pit from where it is carried under a road and up into a cement flume where it can be used to

irrigate the nursery or seedlings that are to be grown for experimental purposes. Any waste that may escape from this flume which may also be used independently of the rest of the system, is carried to the lower ground in a cement waste ditch. Here experiments with hardier plants are to be carried on.

The system covering the fertilizer plots is so connected that all the plots may be irrigated at once or any one separately at any time. An overflow system is used where the water is delivered at any point without pressure. The water rises in a standpipe at the upper corner and is taken out by small adjustable side gates, where the flow can be regulated to a nicety. Any surplus water goes through the overflow and on down the pipe to the next standpipe and so on down the line. The standpipes which act as basins from which the water is drawn, have a slide gate in them so that the water can be allowed to run down the line without rising to the basin elevation when not needed. With this system, water can be delivered to any plot in the center or lower edge of the plantation without getting a drop on any of the intervening trees. No water can run from one plot to the other and mix the fertilizers, and still if enough goes to waste, it can be used for four different purposes in as many different places.

POOR GROWTH.

It is quite noticeable in going through the citrus districts, that the young as well as the older trees are not making a satisfactory growth. Trees on new land look pinched and are not making the large fat leaves that are usually seen. This fact seems so universal that we cannot help laying it to the weather. The weather gets the blame for everything that that does not work right, and still it stays with us.

WHITE FLY PARASITIC FUNGI.

The Experiment Station Record refers to Bulletin 88 of the Florida Station which treats of the use of fungi in combating the White Fly and that success was had in 98 per cent. of cases from spraying the spores of the fungi on trees or by attaching leaves carrying the fungus to trees. In this work the author used *Ascheronia aleyrodes* A. flavo-citrina, the brown fungus, and *Sphaerostilbe coccophila*. The spores of the brown fungus have not yet been discovered, hence they cannot be used in spraying on the trees. It has been found that in the other species the spores retain their vitality for a month, or perhaps longer.

All of the three first-named species of fungi thrive throughout Florida, but a humid atmosphere is essential for their growth. Apparently the best time for starting the fungi in trees infested with the white fly is from May to August. Repeated plantings of the fungi should be made to insure success.

In badly infested localities it is recommended that trees along roadways should be trimmed high to avoid the distribution of the white fly by carriages brushing against the branches. The white fly feeds on a number of trees, including Cape Jessamin, chinaberry, umbrella tree, prickly ash, trifoliate orange and

others. Where these trees are of no value and infested they should be cut down and burned. If it is desirable to use insecticides against the white fly, spraying or fumigation should preferably be done from December to February.

GROW THE KUMQUAT.

The ornamental little Kumquat should be profitable for California growers. They are ornamental and there are several uses for the fruit.

The trees should be set from eight to twelve feet apart each way or they may be planted in hedge form allowing about twelve feet between the rows, placing the trees about five feet apart in the rows. The latter method appears to give excellent satisfaction. The cultivation and care given the Kumquat tree should be the same as for other members of the citrus family.

The Kumquat cannot be regarded as anything else than a fancy fruit, and in most cases a demand must be created. The package best adapted for shipping the Kumquat is the strawberry carrier. Each basket may be lined with fancy fringed paper and the whole crate should also be lined with heavy paper. Fill each basket level full of the fruit and place on top a small twig with two or three fruits attached. The fringed edges of the paper should then be drawn together to form a covering. Various styles of fancy packages holding a quart or less may be used.

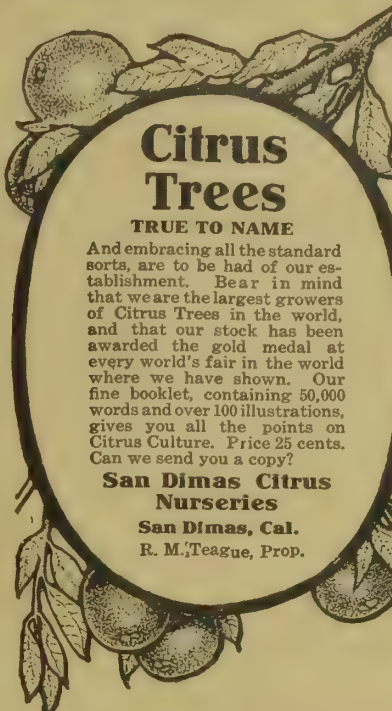

TWENTY-FIVE NEW CARS A DAY.

The Southern Pacific system is now having built 6600 of the most improved refrigerator cars. These are coming into the market at the rate of 25 a day. They are the most expensive cars of this type ever built, and so perfectly adapted to their purpose that the low temperature can be maintained for ten days with practically no variation.

IT'S PENNY WISE.

Policy to set out a good tree, cost-

ing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow Street Los Angeles.

Citrus Trees
TRUE TO NAME
And embracing all the standard sorts, are to be had of our establishment. Bear in mind that we are the largest growers of Citrus Trees in the world, and that our stock has been awarded the gold medal at every world's fair in the world where we have shown. Our fine booklet, containing 50,000 words and over 100 illustrations, gives you all the points on Citrus Culture. Price 25 cents. Can we send you a copy?

OUR ANNIVERSARY.

We are one hundred and thirty-one years old—as a Nation today. We are not aged compared with the governments of the old world, but we have had a wonderful experience in the 131 years of our existence. We have demonstrated that self-government is a success where administered by an intelligent, God-fearing, justice-loving people. We have shown our ability to cope with powers many times our superior in point of years and wealth, and we have established a republican form of government in the face of predictions that it could never be done.

There are those today, who affect to believe that the Republic will some time fall because of our wide-open system of admitting to citizenship undesirable foreign elements. If such a calamity shall overtake our government we have only ourselves to blame. We have noted the effect of this horde on our cities like Chicago, and San Francisco, and yet our national law makers refuse to take the necessary action to protect the country from the ingress of this lawless element.

Almost without exception are these low down, foreign cast-offs enemies of enlightened government, and they are foes to education and religion. Our free school system is hated and our laws vehemently assailed.

That we have received and made citizens of thousands of estimable foreigners is true. That they constitute pillars of strength to the Republic has been proven on battlefields and in halls of legislation, but while this is the case we have been overrun with enemies of good government

until today the problem of their control is one of the most serious that we have to solve.

We do not fear the overthrow of the Republic from this source alone, but we do expect to witness a most serious conflict, sooner or later, with this rabble foreign element which is dominating our great cities. It is this condition which should stir us to action and which we stand in greater danger from than any foreign complications.

As governments are organized, ours is the best on earth, but to preserve it we must exercise eternal vigilance and demand and receive from every citizen strict obedience to the laws of the land. In this way only will our Republic stand through the vicissitudes which mark all nations.

FARMERS MAKE LARGE PROFITS.

We are accustomed to say, unless we are otherwise advised, that the farmers of this nation are inadequately compensated. In reading the report of the Secretary of Agriculture, and also the reports of the various State Boards of Agriculture, we are compelled to admit, and gladly too, that the farmer and stock-raiser who is up-to-date, and follows his occupation with all the energy and intelligent application which is necessary to success in other business callings, makes a larger per cent of profit than any other line of business.

"If prices are so low that a stock-raiser makes only 25 per cent. to 30 per cent. net profit," says a writer in the Rural World, "the air is full of complaints that he is not making any money." We know from experience, as well as observation, that farming properly conducted, is a lucrative, as well as most pleasant, occupation. "We know," says the same writer; "that farmers and stock-raisers are so accustomed to making 50 to 100 per cent. net profit that any per cent. below this seems like a direct loss. Thousands of our most enterprising, up-to-date stockbreeders are making from 100 to 200 per cent. net profit every year on their high-class stock, and we have business statements on file in our office from prominent breeders where they have made 300 per cent. some certain years." These indisputable facts show what can be done on a farm, and they also prove that it is the farmer who is making the largest legitimate profit. If a retail or wholesale store, or any manufacturing concern can show 17 to 22 per cent. net profit at the end of the year, the management feels like celebrating the event with a grand banquet, and the stockholders feel warranted in increasing the manager's salary. Farming is not only the actual foundation of our national prosperity but the farmer makes by far the largest profit, which is right and fair. They are entitled to the cream, and the cities must live on what they can make out of the skim milk. When you add entire freedom from harrowing business cares and absolute independence of financial panics, you have an ideal life that must be envied.

Young man, if you are thinking of leaving the farm for the city struggle and fight, be sure to give careful consideration to these facts before giving up freedom and independence in exchange for business life in the cities, where ninety-five per cent. fail at some time of their heartrending struggle.

HORSES AND GOOD ROADS.

The Secretary of Agriculture, at Washington, is taking more than common interest in the good roads movement in the United States. His home farm in Iowa is removed some distance from market, and naturally he desires to know the actual value of good roads so far as they relate to horses—the moving power of his crops. To ascertain just what value good roads bear to the movement of crops, he has recently prepared a bulletin which is intended to show what well improved roads will do from the point of either a breeder or user of horses. The bulletin explains that the total tonnage of farm products hauled on country roads in the United States is not known, but of twelve leading products it is estimated that nearly 50,000,000 tons were hauled from farms during the crop year 1905-1906 at a cost of about \$85,000,000, or more than five per cent of their value at local markets. Of this traffic 40,000,000 tons represent the weight of corn, wheat and cotton and the cost of hauling these products was \$70,000,000. The

number of working days taken to haul twelve leading crops from farms to shipping points during the crop year 1905-06 is estimated at 21,417,500 and the number of loads taken as 30,319,000.

The greatest time for any one crop in hauling to shipping points is 8,494,200 days for corn, but if the time taken for hauling to local mills the wheat consumed in the counties where grown be included, the total number of working days taken for hauling wheat from farms during the crop year just mentioned would be over 8,900,000. Although there were fewer loads of cotton than of oats, it required 1,000,000 more working days for men and teams to haul the fiber than this grain. The average time for a round trip for hauling oats being 0.6 day and for cotton one day. The greatest distance over which it will pay to haul a given crop will practically limit the production of that crop for the market. Beyond that limit a more valuable product must be made. The bulletin shows conclusively that the value of any given crop is in its proximity to market. If the distance in time can be reduced one-third, by the advantage of good roads, the producer has added just that saving to the price he receives.

IRRIGATION CONGRESS.

We are in receipt of the official call of the fifteenth National Irrigation Congress to be held at Sacramento on September 2-7 inclusive. The object of the Congress is well understood and has been outlined in these columns heretofore. It is national in its scope and will include in its membership some of the most prominent public men in the Nation. The call states that: "The Interstate Exposition of Irrigated-land Products and Forest Products will be held simultaneously with the Irrigation Congress. The largest and finest list of trophies and prizes ever offered, will stimulate competition. The California State Fair will follow the Congress with joint openings and closing ceremonies attended by a great Irrigation celebration, the day closing with a magnificent allegorical Irrigation parade and electrical illuminations.

Especial emphasis is laid upon the opportunity afforded by this Congress for the study of irrigation, irrigation practices and results, irrigated crops of every kind and irrigation opportunities."

There is no doubt that this will be one of the greatest conventions of its character ever held and must result in great good to the state of California to which irrigation is so important.

TO TEACH AGRICULTURE.

"In revising the text books for the public schools of Oregon" says the Spokesman Review. "The State commission has changed all but four books now in use. It is noticeable while civil government has been dropped entirely as a separate subject and mental arithmetic will be given with the aid of the books on written arithmetic, that elementary agriculture has been added in the place of the two text books dropped. It is still more significant that this change in favor of teaching agriculture in the schools is said to have been made in response to a very general demand."

It is quite evident that we are approaching a new era in our high school course of study. Attention is being directed to agriculture as it has never been before. Young men and young women are manifesting a desire for practical farm education and students in our colleges and Universities are turning to agriculture for a future career as heretofore they turned to law, medicine, or journalism. It speaks well for the future of our country when agriculture shall become one of the honored professions and our colleges and common schools shall send out graduates learned in the science of farming—the basis of our national wealth and greatness.

Since the passage of the Pure Food law there will be no palming off of other oils under the label of "pure olive oil." This reform will help the commercial status of the olive oil industry, especially so, as the public has come to understand the medicinal virtues of pure olive oil which is given to sustain and prolong life and to build up the tissues of the body.

News of Country Life in the Golden West

Southern California

Northern California

AGRICULTURE.

Cajon Pass had a big fire last week.

Imperial dairymen are installing milking machines.

The Tri-Counties Reforestation Committee met in Santa Ana on July 1.

The interior valleys have all been taking a sun bath for the past few days.

Mentone had a serious fire last week, some valuable irrigating flumes being destroyed.

Celery growers of the peat lands, near Santa Ana, are having serious trouble with Jap laborers.

The Colorado is still high, but has receded sufficiently that all concern over any breaking of the levees is past.

A brush fire back of San Bernardino last week destroyed 150 tons of hay belonging to John Anderson and D. A. Courteney.

Onions are reported to promise one of the heaviest crops in Coachella valley next year, owing to the successful season just closing.

The Standard says the Imperial farmers will do a large amount of improving on their ranches with returns from this year's output.

San Jacinto Register says that the bounteous crops of this season are causing many improvements in ranch homes about that thriving little city.

An industry which promises much to the peat lands below Santa Ana, is the use of peat in the manufacture of gas. It is said to produce a most beautiful illuminant.

The Santa Paula Chronicle says that the American Alcohol Co. is contemplating a plant for the extensive manufacture of de-naturized alcohol in Ventura county.

The first meeting of the Stockmen's Association, of San Diego county, was held in Escondido last week. The aim is to stamp out the Texas fever in that county. The next meeting will be held on Saturday of this week.

The chili pepper growers of Orange county, being somewhat hot over the prices which they have received during the past season, propose to combine regardless of anti-trust laws and make it warm for the purchaser this fall.

Seventy-five thousand miners' inches are reported as flowing into Salton sea from the New river, but this causes no uneasiness as it is a natural overflow of the flood season, in the old channel and does not injure the levees of the Colorado.

The Salton sea is now being recommended by the Submarine as a health resort. With the weather which the papers report prevailing there now, this is possible, for we note that the cold wave sweeping over that section has lowered the temperature to nearly one hundred degrees.

The Huntington system which owns the Los Angeles, Riverside and other trolley systems, has purchased the San Bernardino and Redlands systems, which probably means that the connection with Los Angeles will soon be made; the Redlands suburbanites will be able to reach Los Angeles on the electric car.

HORTICULTURE.

Muscat grapes are appearing at Imperial.

A new cannery is being built at San Jacinto.

Hemet ranchers are receiving \$11 a ton for alfalfa.

Three cars of tomatoes per week are shipped from Thermal.

Application has been made for a rural postal route at Hemet.

Hemet's grape crop is reported to be very satisfactory this season.

Extension of the date planting industry is being made near Indio.

Canners at Santa Ana have purchased peaches at \$65 to \$70 a ton.

Washed Corona navels brought \$5.50 per box in New York last week.

All citrus sections report setting for an immense crop of oranges next year.

Special night cars are sent out of the Imperial valley loaded with cantaloupes.

Shipments of oranges from Riverside now aggregate well up toward 6000 cars.

Dangerous brush fires are reported to have done much damage in the hills near Azusa.

Elsinore apricots are reported fairly good crop and bringing the highest prices ever.

The Gregory Co. has installed machinery for canning fruit at its packing house in Colton.

But few cars of oranges remain in Redlands to be shipped. The total is now about 3200 cars.

Santa Ana officers are arresting fruit thieves who were simply passing by and took "one to eat."

Mentone is entirely without water owing to brush fires burning out its water supply flume last week.

Highland reports great profit from grapefruit orchards this year, trees giving a gross return of \$1000 an acre.

Cantaloupe prices have been good in Imperial valley section, and the fruit reported of higher quality than usual.

Deputy State Commissioner, Maskew, has distributed a large number of lady bugs to battle with the melon aphids of Coachella valley.

The Upland News is making an earnest appeal for better roads, especially that her one magnificent avenue, Euclid, shall receive more attention.

Reports coming in of the pre-cooling plant of the Santa Fé Railroad Co. at San Bernardino are in effect that will prove a satisfactory proposition.

The Riverside Water Commissioners are considering a special tax of irrigated lands, say 10 cents per acre, for the purpose of providing funds to aid in reforesting water sheds.

Institutes held last week in Ventura county and at Pomona under the direction of Mr. Neff, are reported by local papers to have been productive of great good to those sections.

The Highland Messenger says that the crop of oranges setting for next year has one peculiarity in this, that there is a great diversity of size, ranging from small marble size up to one inch in diameter.

AGRICULTURE.

Beet pulp is being used for fattening cattle at Willows.

About one hundred acres of barley were burned last week near Kerman.

Kerman says that the alfalfa growing is proving popular in that section.

Corcoran real estate is on the jump owing to satisfactory crops in that section.

Shipping of draft horses from Hanford to San Francisco is proving profitable.

Tulare county says that she also wants that \$500 first prize from the State Fair.

The Diamond Match Co. will erect a big plant for making turpentine, at Sterling City.

The big Empire ranch, near Lemoore, will produce a fine crop of grain this season.

Petaluma Poultry Association is still pushing its plants for the next poultry show.

Heavy shipments of hay are being made from Winters. The output will be greater than ever.

Bids will soon be asked for additional buildings to be constructed on the State Farm, near Davis.

The spring clip wool is bringing 25 cents at Ukiah. A warehouse now has about 140,000 lbs. of wool stored.

Some magnificent trophies are offered for irrigation exhibits at the coming National Irrigation Congress.

The State Fair management is offering special prizes for county exhibits at the coming fair amounting to \$1550.

The Hanford Sentinel reports one grower having exhibited 55 large wheat heads, the product of one kernel grain.

Petaluma poultry raisers are being hit by the move of the Express Co., that no more empties shall be returned free.

Sawdust dumped in the river by the mills east of Fresno and Tulare counties is causing death of many fish in those streams.

Six men were recently arrested at Visalia for carelessness in causing a fire which destroyed large quantities of standing grain.

Fresno hay is now on the jump and commanding top notch prices. The crop in that section is said to be larger than usual.

A large dairy ranch established near Wheatland, is said to be the forerunner of an up-to-date creamery soon to be established.

There is to be a civil service examination on July 23rd and 24th of the applicants for the position of U. S. Forester near Salinas.

The directors of the District Fair, at Hanford, are taking steps to give one of the finest fairs this fall, in the history of the association.

All the towns in the neighborhood of Salinas are appointing large numbers to attend the irrigation meeting soon to be held in that town.

Kings County Fair Association will offer prizes for the finest exhibit of agriculture, also of horticulture, by various counties of that section.

HORTICULTURE.

Canners at Gridley are offering top notch prices for peaches.

The Hanford cannery is about to begin operations on peaches, the crop being exceptionally fine.

Five cents is being freely offered for the four prizes of prunes, coming crop, about the San Jose section.

Two hundred and fifty tons of cherries were shipped from the little town of Cordelia in Solano county.

A move has been made for a new cannery at Watsonville, to be constructed by the Pajaro Packing Co.

A meeting was held last week at Orosi, to discuss the matter of a canal, to dispose of storm waters of Sand Creek.

The Woodland Chamber of Commerce is another applicant for the first prize of \$500 for special county exhibit given by the State Fair.

Pear trees in Shasta county are seriously threatened by blight owing to carelessness in not following Prof. Waite's instruction for handling this disease.

Armenian raisin growers are refusing to sell raisins at 5½ cents, and it is thought they are combining to force the price to 6 cents for the coming crop.

Peach planting will be vastly increased this coming season over the San Joaquin valley because of the magnificent crop and big price secured for it this season.

Seventy-five dollars a ton for peaches near Visalia. Seems too good to be true, but it is the condition prevailing over the great peach section of the San Joaquin valley.

The pear orchards about Cottonwood, Shasta county, where some of the finest pears in the world have been grown, have had their output greatly reduced by the pear blight.

Steamers plying between Sacramento and San Francisco are now loaded to the rails with fresh fruit and potatoes. This traffic is now said to be better than ever before at this season of the year.

Some growers in the hop growing section of the North maintain that hops are now selling below cost. It is maintained that the cost to the producer is approximately 8½ cents per pound.

Selma reports a strange condition present in a vineyard belonging to Mr. Olsen. It is in the nature of a blight. The grapes dry and the center of the stem turns black from some cause not yet explained.

Pear orchards about Redding are reported in bad condition and some orchardists are claiming that the pear industry is doomed in that section unless greater care is taken in stamping out the blight.

The people of Watsonville had a jolly scrap over the selection of its most beautiful young lady to represent the goddess of fruits at the July Fourth celebration. Watsonville girls are all the best looking all right.

A bumper crop of Malaga grapes is promised in the Fresno section; but the shipments of green fruit will be less than heretofore, because the higher price now promised for raisins will induce more general drying of the grape.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

WANTS TO KNOW.

THE following letter from a subscriber has the right ring to it.

She not only reads The Cultivator, but we judge by the tone of her letter that she knows the standard requirements of her chosen breed the Brown Leghorns. We certainly agree with Mrs. Subscriber in what she says about the Brown Leghorns, and think that more attention should be given them. May we not hear from some of our breeders who have compared them with other breeds.

The Letter.

We have taken your paper for over three years and I wish you to know how much I have enjoyed and profited by the poultry department. I knew scarcely anything about chickens when I began reading your articles and I have been more than ordinarily successful by following the directions on care of chickens and I feel very thankful for this help. Now you say your new editor is equal to giving us any information we wish if he can only find out what our requirements are. You could not write too much on the breed and mating of Brown Leghorns to please me.

I wish to ask a few questions which I will be pleased to have answered in The Cultivator.

When a breeder says a pen is mated for cockerels that means the cockerels will be the standard.

I can't understand why I would have to use double mating, as I do not care to show my birds but I want my pullets and hens as near standard as possible.

I can't see that I have any use for the cherry red cock that the standard calls for. Please explain.

I sent for a high-priced setting of eggs and told the breeder that I wanted the eggs for the cockerel to mate with my hens to produce standard pullets. They are now ten weeks old and I have five fine-sized cockerels, but no comb is perfect although the parents are prize winners. Two have six points to comb and on two the comb is far from stiff at base in the front.

As they develop, all birds being equal in other points, which would you consider would produce best standard pullets. The fifth cockerel was off in color (much too light when hatched) but is now nearly as dark as the others.

Do you think it would be safe to breed from him, providing his color is good when matured? I would not do so for anything if I thought his chicks would be light for I never keep a chick that is off in color when hatched, for I do not feel there is much money in broilers and I would not have an off-colored hen on the place. My culs have to go.

I feel there is far too little said in praise of the Brown Leghorn. I am perfectly in love with them, after trying several breeds. I would be delighted to see as much written in their praise in the Cultivator as has been on the Wyandottes. My experience is that you can feed one hun-

dred Leghorns with same feed that about 60 of the heavier breeds require. The heavier do not lay as many eggs and no larger in size. Of course, I know I got good stock to begin with.

Big Enough to Eat.

People say, "O, but when we want one to eat we want something." I weighed one of my hens a few days ago that will have to be turned off this fall and she weighed five pounds, and I consider that not a bad meal. Another thing I dislike is to read—"Get your Leghorns heavier." Why not let a Leghorn stay a Leghorn, and for one who wants a heavy bird let him get a heavier breed. I don't want my two-year-old hens to weigh over four and one-half to five pounds.—[A Subscriber, Pasadena, Calif.]

Cockerels or Double Mating.

Cockerel mating means that the cockerels will be standard, or exhibition color, while the pullets will not.

It is not necessary to practice double mating when you only want birds for utility purposes; however, you will find that when you change the color that the standard calls for, your Leghorns will lose much of their beauty, and we very seriously doubt your being able to produce and reproduce the standard color unless you do use the double-mating system.

The cherry red you speak of in the cock is of not material use, unless you wish to sell eggs at a fancy price for hatching. Then your customers will expect to get eggs that will produce standard-colored birds.

In selecting a cockerel for breeding get one with the best color and comb possible. We would rather have a four-point comb than six-point. We never saw a perfect comb in a Leghorn male.

The color of the chick makes no difference if the bird is the proper color when he develops.

We consider a four and one-half and five-pound Leghorn a good sized bird and think them large enough, but many Leghorns only weigh three and one-half to four pounds. This is the size we are talking about breeding up.

AROUND THE YARDS.

THE LAY OF JOE BING'S HEN.

Joe Bing has got a hen that lays Two eggs per diem—see!
An' when she feels eggs-act-ly right Blamed if she don't lay three!
That old blue hen, he cackle-ates, Is bound to raise the score;
She's never sat—Joe 'tends to that At Luscomb's grocery store!

—[Woman's Home Companion.]

If you love your birds your works will show it.

Our misfortunes keep the price of poultry and eggs up.

The woman who raises poultry always has ready money.

Hens that are not good feeders, as a rule, are poor layers.

To cultivate the acquaintance of you flock means success.

If you want eggs when prices are highest means good treatment for the hens these warm days.

Equal parts of oats, barley and buckwheat, all ground, is a good fattening food which produces white meat that is superior to corn-fed flesh.

The chaff from the barn floor thrown

July 4, 1907.

under a dry shed for the hens to scratch over for seeds and fine bits of hay is worth a great deal, and cannot be put to a better purpose.

One of the greatest troubles in feeding poor grain is not altogether in the loss of nutriment as compared with good grain, but in the fact that poor or musty grain causes many of the diseases to which fowls are subject.

Crop-Bound.

Mrs. McV., of Sacramento, writes that she has a hen with a very large crop, and upon examination, found that it seemed to be filled with grass, the hen would not eat. She worked the crop with her fingers, as well as she could, thinking this would relieve same, but found in the morning that the hen was not better. Is she crop-bound, what is the cause, and can she be cured?

Your hen is undoubtedly crop-bound. It may be caused by several things; we have known birds to eat a banana peel so large that it became crop-bound. Sometimes long grass that is partly dry will cause it. Cure—First, always have plenty of sharp grit before your birds as a prevention. If your bird only has a mild case give a tablespoonful of sweet oil. Knead the crop gently and try to force the contents out of the mouth, holding the head downward. If this fails to give relief an operation will be necessary. To do this make an incision in the outer skin with a very sharp knife, about one and one-half inch long; it should be at the top and should be up and down. Slip the skin to one side and then make an incision in the crop proper which will not be opposite the one in the outer skin. After making the second incision remove the contents of crop with the finger; clean it well with warm water to which has been added about four drops of carbolic acid to an ounce of water, then stitch with silk thread, care being taken not to sew crop to outer skin. Give no food for twelve hours, then for four or five days give soft food, such as bread soaked in milk. After this regular diet may be given.

Egg-Eating.

I have a few birds that eat their eggs. Can you suggest anything to break them from it?—A. B. Hanford.

First—Remove all birds from pen if there are any that do not eat their eggs, that they may not acquire the habit. Then darken the nests so the eggs can't be seen so readily. Feed plenty of oyster shell and meat, and leave china eggs lying around the yard for them to peck at; this will generally break them up.

GIVE CHICKS CHARCOAL.

When chicks are fed mash it is a great benefit to them to add a little powdered charcoal to their food. Have the mash moist enough so the charcoal will stick. The chicks will soon learn to like it and will eat the mixture as readily as plain food. When they get older feed the charcoal alone and see how they will eat it. It is a fine thing to keep them healthy, for it is a great corrective, preventing fermentation of food in the crop, and for that reason is a great aid in warding off bowel complaint.

However it be, it seems to me, 'Tis only noble to be good. Kind hearts are more than coronets, And simple faith than Norman blood.

CHICKENS IN HOT WEATHER.

It is well to remember that chicks grow fast and a coop that had been plenty large enough for brood when young, will soon become too small and overcrowded, and in consequence injury to their health and growth will result. More room should be given at once if overcrowding is noticed, either by providing larger coops or dividing the broods.

It will be found best to give growing chicks as much range as possible. If necessary to confine them, have as large yards as can be provided. Chicks should be fed apart from older fowls. If all are fed together, they will be apt to get an insufficient amount of food and the older fowls will receive too much and in consequence become too fat. Regularity in feeding is another important matter. If chicks are fed at certain times when on free range, it will be found that they will be near or about the feeding place at that time and all will share alike, whereas if they are fed any old time, some may have wandered off in search of bugs and insects and therefore miss their portion.

One of the most important things to be considered during the summer is the water supply. The water should be kept in some vessel or fountain that will prevent the chicks from walking in it, or else the water should be changed frequently.—Orange Judd Farmer.

FEATHER PLUCKING.

A correspondent of Country Gentleman tells of a very serious outbreak of the feather pulling habit among a flock of young Leghorns hatched in an incubator about April 1 and reared in a brooder. They had been given ground bone from the time they were three days old. When about three weeks old, they begin picking at each other until several got into the habit of attacking one chick, and if it was not taken away by the owner, the flock would actually kill and eat it. The only way he could prevent their picking each other was by keeping meat lying by them constantly. Country Gentleman comments on this as follows: "We do not think that feeding ground bone had anything to do with the chickens picking each other. Where a lot of young chickens are kept together this way in a brooder, do not have out-door exercise, do not have natural surroundings that they demand, they often form the bad habit of feather pulling. The blood begins to flow, and then they quickly attack the blood spots and thus kill the young chicks. Nothing seems to cause poultry, old and young, to pick each other as the flow of blood from any one of them. All the meat and bone in the world will not prevent this. Nothing but out-door exercise and natural exercise and natural surroundings will cure this habit when once it is learned. As to the advisability of feeding bone meal, or ground bone, if you mean dry bone meal, a little a day is good, too much injurious; if you mean cut green bone, a reasonable amount of this is good for them. Many of these troubles come from too much care and coddling." All this comes quite close to the truth. And an ounce of prevention in this, as in most cases, is worth a pound of cure.

What do we live for, if it is not to make life less difficult to each other? —George Eliot.

Diet, Not Dope

In a speech before the Medical Institute in London, England, the other day the physician for King Edward called the attention of the assembled doctors to the fact that the use of drugs was being superseded by the use of proper food, air and exercise; and he was glad of it, believing the less drugs put into the system the better. With man so with chickens.

Use good diet. A. C. W. Foods, plenty of fresh water, a good yard to run in and you will have no trouble with poultry.

Molting Time

Is the time to provide for eggs when they will be scarce and high. Don't let your hens molt for months. Don't let them get completely run down and all out of condition. This they will certainly do unless you use care and intelligence in feeding them through this trying season.

West Coast Egg Food

Is a highly nitrogenous Poultry Food, rich in protein, composed of the finest grains, seeds, roots, salt, iron, charcoal, condiments, shells, oil cake, bone, meat and dried blood to keep the poultry in good health, build up a strong and vigorous system, make the hen molt early and convert the surplus aliment into eggs. It is a full, scientifically balanced ration containing no filler but every ounce is pure food. Many so-called "Poultry Foods" and "Egg Makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

Is what they need for a short time; that is just what its name implies. But it is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it does not make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that a hen has no use for the shell until she has made the egg.

West Coast Egg Food

Is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve the purpose of assisting the hen in her molting and then in producing eggs, and at the same time to build up her system and keep her in the best of health. The hens like it, they eat it, there is no waste, hence it is the cheapest Egg Food on the market.

West Coast Egg Food

can be fed either as a mash or as dry feed, though we recommend the latter because it is more natural and, we think, the better way. Don't ask Biddy to fill the egg basket without giving her good care and providing her with proper material for the purpose. Feed her West Coast Egg Food. For sale by many dealers. If yours doesn't keep it, or will not get it for you, send direct to us.

PRACTICAL POULTRY CULTURE.

At a farmers' institute where I was billed for a talk on plain poultry raising, I met a man I thought would make a good match for a self-winding clock, says Fred Grundy in Commercial Poultry. He tackled me soon as I reached the town, and let up only while I was telling the folks about practical poultry raising. I did finally manage to escape him about an hour, while I chatted with some ladies who desired a few instructions in raising chickens, and I asked what sort of a poultryman he was. A neighbor of his said he was a genuine chicken crank. He kept himself poor buying this thing and that to aid him in his poultry business, and he was always going to do wonders, but never had accomplished anything up to that time, and she thought he never would.

A Successful One.

"Now," said she, "I'm going to bring in the most successful poultry raiser in this locality, a little bit of a woman who says nothing, but does things." Presently she returned with a little, timid woman who looked about as much like a poultry raiser as I did like the governor of the State. After talking to her a few minutes she began to ask questions, and soon got so interested that her natural timidity disappeared and she began to tell about her poultry work, what she had done and was doing. She had solved about all of the problems that poultry raisers run up against and was doing a good and profitable business. She believed in first-class stock and kept her's as near top notch as possible, but she said she never discarded a thoroughly good bird because it was a little off in color. She said combs, eyes beaks and shanks all looked alike to her when they were on birds of good shape, size and color. She thought a uniform color was a good thing because it indicated good stock, good breeding and some pride in the flock. Then it was a great help in preventing trouble among the fowls. A bird of an entirely different color to the rest of the flock was sometimes set upon and harassed to death, while hens would often kill chicks that were different in color from the rest of the brood. Where all were of a uniform color no trouble of this sort ever occurred.

Plows Her Yards.

This little woman was as practical as a railroad manager, and she was making money right along, while the talkative crank mentioned was spending all, and more, than he made on wonderful machinery and new breeds. The previous year her receipts for eggs and fowls were nearly \$500, and that season would exceed that amount. She had four poultry yards and all of them were plowed over twice a year and seeded with oats, millet or rye. She had learned that the shortest route to bad luck with poultry was to keep them on the same ground year after year without turning it over and growing some sort of a crop on it. She said she liked my poultry talk at the institute better than any she had ever heard because it was plain sense, and she intended to adopt many of my suggestions. Of course this sounded good to me, much better than the criticism of the impractical crank mentioned, who said I should have shown the great value of high scores, and told how much some of the leading fanciers are making each year, and more about the greatness of the poultry business.

Two Sorts.

There are two sorts of poultry raisers in the land. Those who talk, and those who do things. The talkers are

quite often also writers, and some of them have led many a poultry raiser into blunders that took him out of the business in short order. Those who do things are saying little, but sawing wood. One of the most voluminous writers on farm topics I know is not farming a foot of land, and has not for years. Yet he is mentioned in the papers he writes for always as "Farmer" So-and-So. He farms on paper and in his mind. There is a change coming in the poultry business. Its possibilities are becoming better understood. There will be less theory, trumpery and pipe dreaming, and more practical business. There is good money in it when it is managed right. I personally know hundreds of poultry raisers and know just what they are doing. I know that some of them are making money every year, and I know that others are not making a penny. The first are the practical class who earn more than they spend. The latter spend more than they earn. I know a merchant in a small town who keeps a small flock of good stock to supply him with eggs and chickens, as he says he despises the stuff they keep at the grocery stores and poultry house, and I am satisfied that his eggs cost him from three to five cents apiece. He buys all his feed, and buys the most expensive. He keeps the poultry house as clean as his wife keeps her kitchen. In the same town is a workman who keeps a few fowls for the same purpose as the merchant, and his eggs do not cost him one cent each. He feeds them on the table scraps and grain. The grain he buys direct from farmers. Every evening they fill up on grass from his lawn. In the morning they get the green waste from the garden vegetables. His flock is always in the best of health and he gets full four times as many eggs as the merchant referred to.

I am satisfied that many more people would keep fowls to supply them with fresh eggs if they knew just how to go about it. But there are thousands who know no more about poultry than the young wife who ordered a package of egg plant seed, declaring that she would not pay the high price demanded by the grocer for eggs, but would raise her own.

DISINFECT.

From this time on one of the principal things to combat in the poultry houses will be lice, and as "an ounce of prevention is better than a pound of cure," the sooner you get to doing some of the preventing the better. Whitewashing the poultry houses is absolutely necessary, preventing and exterminating parasitic and other insect pests, and at the same time acting as a disinfectant. In all houses where poultry is kept, its value can not be overestimated, and where used frequently, insect life is practically extinct. Make as follows: Mix unslacked lime and water till they are of a consistency of gruel; then add a small quantity of carbolic acid to extirpate any insects that may exist, and finally a little soft soap, to make the whitewash stick. This mixture is then ready for application to the building and should be applied evenly with a brush, and well worked into all corners and crevices, thus leaving no untouched space for insect life to hoard.

The Antelope Valley Ledger says that the blossom of the sage is now being supplemented by the greasewood and Spanish bayonet bloom, and that the bees are fairly reveling in good "pasture."

Irrigation and Forestry

A NEW CALIFORNIA MAP.

ABROAD desert valley, through which a sluggish river flows, walled in on both sides by rugged mountain ranges whose peaks tower thousands of feet above, is the striking feature presented by the map of the Mount Whitney quadrangle, Cal., just published by the United States Geological Survey. Few of the maps issued by the Survey can be examined with greater interest, since areas within the United States comprise greater variations in topographic forms than the 960 square miles there delineated.

The Mount Whitney quadrangle is a part of East-central California and includes portions of Inyo, Tulare and Fresno counties. It is crossed in a general southeast-northwest direction by Owens Valley, with Owens River hugging the east side and discharging into its sink, Owens Lake, in the southeastern corner of the area.

On the east, Owens Valley is bordered by the Inyo or White Mountains, a typical desert range, with a number of peaks over 11,000 feet high, with no perennial streams, and with few springs. These mountains, however, contain valuable mineral deposits, which are mined at a number of places.

Along the west side of the valley stretches the Sierra Nevada, presenting to the east an abrupt, almost precipitous wall rising from a height of about 4000 feet to over 14,000 feet in a distance of less than 5 miles, and topped by the highest peaks in the main body of the United States. Mount Whitney, named from Prof. J. D. Whitney, former State Geologist of California, rises 14,501 feet above sea level and, closely rivaling it in height, Mount Williamson attains 14,384 feet. Six other peaks in this region are over 14,000 feet high, and there are many that fall just below that height. The numerous high peaks and glacial gorges and the thousands of little lakes that diversify the rugged west slope of the Sierra are famous summer camping grounds for Californians. Across the northwestern corner of the quadrangle winds the South Fork of Kings River in a gorge a thousand feet deep, while in the southwestern part of the area Kern River traverses its wonderful canyon.

Owens Valley is a barren desert except where reclaimed by waters entering it from the mountains, and Owens Lake contains so much soda that its extraction has been found commercially profitable. The river itself for many miles above the lake is also saline, but the numerous streams that drain the west slope of the Sierra carry fresh water in abundance. The valley is traversed by the Nevada and California Railroad, a narrow-gauge line that will probably soon become part of a trunk line connecting the gold fields of Nevada with Los Angeles. Another connecting link with the city of Los Angeles will be formed by the pipe line which, taking water from Owens River near its head, will pass along the west side of the valley, tap all the mountain streams which it crosses, and finally deliver its supply to the city. This gigantic enterprise will be accomplished at a cost of \$23,000,000.

The various natural and cultural features of the region are shown on

the map with as much fidelity to detail as the scale, 1 inch to 2 miles, permits. Valleys and peaks, lakes and rivers, settlements and isolated houses, roads and trails are accurately located, and there is even marked, on the southeastern corner of the sheet, the fault line resulting from the great earthquake in 1872.

PLANS FOR WATER RESOURCES INVESTIGATIONS.

With its appropriation reduced from \$200,000 to \$150,000 for the fiscal year 1906-07, and a further reduction to \$100,000 for 1907-08, the water resources branch of the Geological Survey has been obliged to curtail work in many directions in order that the funds available may be made to meet expenses. The plans for the coming year, however, as announced by M. O. Leighton, Chief Hydrographer, include important investigations.

Measurements of the quantity of water carried by important streams in many parts of the United States will be made as heretofore, and for this purpose over 600 gaging stations will be maintained in 42 States. In California, Washington, Oregon and Maine the work will be conducted in co-operation with the States, and many stations will be maintained by the Survey for the Reclamation Service in connection with projects whose construction is contemplated or under way.

Special ground-water investigations will be carried on in the Coastal Plain of the Atlantic and Gulf coasts, in Ohio, Indiana, Minnesota, California, Washington, Oregon and Texas.

The Coastal Plains investigation, which is of peculiar importance, is co-operative between the geologic and water resources branches of the Survey and the Geological Surveys of the interested States. The work is under the general supervision of a board of supervising geologists, of which Prof. W. B. Clark, State Geologist of Maryland, is chairman.

An investigation of the ground waters of Ohio and Indiana was begun last year, and a report on an area in the southwestern corner of Ohio, with Cincinnati at its southwestern and Springfield at its northeastern corner, has been prepared for publication. It is planned to extend the work further this season, and field work will be begun shortly after the first of July.

In Minnesota, also, the work planned is in continuation of that begun last year, when field investigations covered 22 counties in the southeastern part of the State. During the coming season the work will be carried northward and westward from the area already examined.

In California the investigation of the underground waters of the San Joaquin Valley will be carried to completion; in Oregon and Washington ground-water studies will be made in areas not yet fully decided upon.

The work on the Texas ground waters is in continuation of investigations that have been in progress for several years and on which a number of reports have already been published and others are in preparation.

Special investigations of the quality of surface waters are to be carried on in Kansas and California in co-operation with the States, studies of the pollution of streams by industrial wastes are to be continued, and the in-

vestigation of the fluctuation in the mineral character of the waters of rivers and lakes will be rounded out and completed.

The last work to be mentioned, though by no means least in importance, is the study of what is known as the debris problem in California, a study whose results will find application far beyond the confines of the State whose necessities gave rise to it. The details of this investigation have been stated a number of times.

COOL DRINKING WATER ANYWHERE.

There is a vast difference between just wet water, as it comes out of a canteen or jug which has been carried in the hot sun, and a cool, refreshing drink of water as it comes out of Appell's South African Water Bag.

Although made of canvass (therefore much lighter to carry than the jug or canteen) this bag holds water perfectly, is strong and durable and, by the simple principle of evaporation, will keep the water remarkably cool for fully forty-eight hours.

It is a delight to all who tramp or ride, whether for pleasure or business, and every sportsman, prospector, surveyor, miner, ranger, farmer, yachtsman, fisherman, timberman, threshing crew, millman or railroad man who has ever carried the Appell South African Water Bag includes it as one of the indispensable articles in his "kit". Although but a recent invention, these bags may now be had from all hardware dealers, so general has the demand become. They are made by the Adam Appell Company, of Portland, Oregon.

The Colorado River which, after receding from its recent high water, commenced rising again last week, caused some uneasiness. It is now receding and it is thought no further rise will be made this season.

AN ADMIRAL WITHOUT COST

3 FEEDS TO THE ROUND

2 PROFITS IN HAY BALING

The difference in the increased earnings of the ADMIRAL THREE-STROKE SELF-FEED PRESS more than pays for the press in one season, at a conservative estimate of 2½ tons per day over the old style two-beat, foot-feed press, besides the ease of labor on both men and team, and better work. Let us figure a little to convince you.

2½ Tons per day for one week, 15 tons at \$1.50 net.....	\$ 22.50
One month's earnings over the other press (26 days).....	97.50
On an estimate of five months' work out of the year.....	487.50

The above gain with the ADMIRAL more than pays for the press.

Planting Alfalfa.

I have a quarter section of irrigated land at Las Banos, (Merced C.) and I would like to know if October would be a desirable month to plant it to alfalfa. How many crops of alfalfa do they get a season at Las Banos? The land is leased up to next October and I am anxious to have it put in alfalfa as soon as possible.—P. W. P.

The latter part of October or the first of November will be better for sowing alfalfa than the very warm, dry months earlier. If sown too early there is danger that the surface of the ground will dry and the seed will not germinate well, or if it does germinate, that there will not be enough moisture in the surface to keep the young plants alive until they root down to the more permanent moisture.

The planting should, however, be early enough so that the young alfalfa will have made a few inches growth before any heavy frosts, as it sometimes happens that frost will kill alfalfa that is just coming through the ground.

The land for an alfalfa field should be well graded, as every dollar spent in making the field of the proper grade will be repaid many times over in the saving of water and labor during the life of the alfalfa, besides if there are any depressions where water will stand it will likely drown the alfalfa. The seed should also be carefully examined to be sure that it contains no dodder or other foul seeds. Dodder seed is only about one-half the size of alfalfa seed and may be separated by a screen, but the safest way is to buy seed that is known to be clean.

With favorable weather and plenty of water seven crops of alfalfa may be expected in a season. Five of these should be heavy crops with a lighter crop at the beginning and end of the season.—J. B. N.

Best Time To Trim Orange Trees.

What is best time to trim orange trees? What kind of fruit, if any, can be grafted on loquat stock? What time are olives gathered?

Orange trees should be planted as soon as the crop is off, and while the job is being done a picking bag carried by the pruner will sometimes bring in enough oranges to pay for the pruning. This is often the case where a mixed gang of pickers are used. We refer to pruning that is followed up every year. Where heavy pruning is done in re-shaping the tree it should be done after the cold weather has passed which makes orange growers reflect on the lot of the crowned head that rests so uneasily. Don't do heavy topping before this period.

We do not know that the loquat is used as a stock for any plants other than loquats, but loquats are quite often budded on quince. How quince would behave on loquat, we are not prepared to say. It may do well.

If you wish to pickle the olives, pick them when they just begin to turn in color. If you wish to make oil, let them ripen on the tree and if

they shrink some it will not matter.—J. W. M.

We may add that the season of ripening olives is from October on into the winter months.

Powdery Mildew.

What is the matter with my muscat grapes? The vines blossomed very full but a great many of the grapes are falling off with the blossoms. The vines are six years old; on good mesa land, part of it well manured.—J. W.

You may have powdery mildew and it may be that you have not exactly the right conditions for the muscat. It drops badly in a great many places and no amount of proper treatment will make it bear. If you have powdery mildew it will show on the other parts of the vines and especially on the new growth. In the event that you have it, use sulphur at once. This will not bring back your grapes but it will help the vines.

The Cultivator recently published directions for using sulphur which, if followed, will give you all the help possible under present knowledge of the subject.—J. W. M.

Cobwebs on Grape Vines.

What is the trouble with my Muscat grapes? During the period of blooming there seemed to be a web resembling a spider's web form over the bunches; this web was on nearly all the bunches; on some much more than others, but seemed the worst in the center of the vine where the sun and air could not get to them; this web caused them to drop until the bunches were bare stems. Vines have been well cultivated and all sulphured once and part of them twice. The vines are four years old and have not been irrigated yet this year.

There are a number of vineyards here affected in the same way.—Subscriber, Sanger.

The web to which you refer is quite common in some sections and the cause of dropping has been assigned to it in many cases, but as yet we have no evidence that the webs have any bearing on the case. While in the Imperial valley, recently, we saw signs of it and one man said that he simply went through the vineyard and "clawed" the webs with his hands and that was the last of it. It seemed to be a good plan to follow where there is any suspicion that they injure the vines.

Pruning Young Plums.

I have two plum trees, one year set, with long, slender branches bending over nearly to ground. Shall I prune them now or when?

If you refer to last year's growth, cut them off now about a foot from the point of branching. If you refer to this summer's growth, let them grow and cut them off next winter unless they are taking up too much room (suppose they are city lot trees) in which case you might top them so as to make them branch. This however, will retard their growth. If you did not prune the trees last winter, it was a mistake. French prune trees make more substantial trees without being pruned during the first few years, but they are differently constituted than the regular plum which is better handled by pruning.—J. W. M.

Bees and Their Care

FACTS ABOUT BEES.

THE Queen—There is sometimes a question as to there being a queen present in the hive. If the comb can be pressed far enough apart to see the presence of capped brood in the hive, the keeper may rest assured that there is a queen present. Or if the bees are passing in and out with pollen on their legs, it is safe to conclude that the queen is in charge. Pollen is gathered to feed the young larvae, and if there is no queen there can be no larvae, and consequently, no pollen will be gathered to feed the larvae.

Watering the Bees.

When the dry weather comes it is necessary to keep a little water in a vessel near the hive. The bees, as well as chickens, hogs and horses,

the most favorable circumstances. We think that under the average circumstances this amount is too large. Better success will be the result if only twenty-five pounds and not more than thirty-five pounds of honey are removed. If there has been an insufficiency of flowers during the honey-gathering season, and but little honey has been collected, all should be left for the bees.

BEES AND OFFENSIVE ODORS.

"Never work at a hive when you are sweating. Bees have a strong dislike to the exhalations of one in a perspiration." That is the advice given in a foreign bee-paper. Some beekeepers in this country, with hundreds of colonies, will smile broadly upon reading such advice.

BEE NOTES.

Some beekeepers work hard all the season to secure a crop of honey, and then store it in such an unsuitable place that when it reaches market they do not get nearly so much for their labor as they would had they spent more thought on having their product reach the market in an attractive condition.

Many in the East store their honey in an upper room or attic. Where this can be done, there is no better place to keep it.

In two or three weeks' time the honey will thoroughly ripen, when it can be prepared for market.

All propolis, or bee-glue, should be carefully removed from each section. This is easiest done with an old table knife.

The honey should be piled a few inches off the floor, and a little out

Beautiful and Fruitful Tulare

need water. Perhaps, in proportion to its size, the bee drinks more water than any other animal or insect. The water is needed to mix with the honey and pollen when feeding the young larvae. The water should not be too cold, or it will chill the bees and have a detrimental effect.

Starting.

Those who have had no experience in the bee business, but who wish to engage in it, should start in a small way. As with poultry, or any other division of the farm, the keeper has to grow and learn with the business. The man who starts in extensively, with no experience, will surely make a failure. Begin with eight or ten stands, and learn the habits and requirements of bees thoroughly before going into the business extensively.

Removing Honey.

The amount of honey to be removed from the hive will depend entirely on the amount of honey the bees are able to collect. If there is an abundance of flowers and the swarm is able to collect a large amount of honey, more can be removed than if only a little were collected. Experienced beekeepers say that not more than thirty-five pounds of honey and twenty pounds of comb should be taken from a colony under

It would work best in a locality where the flowers secrete nectar only in freezing weather, if bees are to be kept on a large scale.

There is an idea among many people that the smell of buttermilk will also anger bees. Before the days of creameries, my milk house overlooked the bee-yard. Sometimes when a swarm came out I would forget to take off my big apron, all spattered with buttermilk, until I was in the thickest of them. The bees attended strictly to their own business and never paid the least attention to the scent of buttermilk.

But I found to my cost that they are very sensitive to the smells of rancid grease. I found an old box that was just right as a rest for a hive of bees. I placed it on the north side of the lilac bush, and put a hive on it, all ready to set up housekeeping. The first swarm I put in came out and went back into the tree where they had first settled. I humored them by putting them into another hive where they staid cheerfully. Two other swarms refused the lilac shade. Then I investigated things and found that the old box had been used for years to set cans of machine oil on. I burned the old box, gave the bottom board a good airing and had no further trouble.—Coleman's Rural.

from the wall; otherwise than near the bottom and side of the room will accumulate moisture.

Comb-honey is often materially injured by removing it from the hive and packing it in shipping cases.

Honey that is sealed will stand much more dampness than that which is unsealed.

Comb-honey sells more readily from looks than from anything else. The nicer its appearance the better the price.

WHY NOT?

The opening of Agricultural Park as a public park on the plans now proposed by the board will give to Southern California a park and a speedway second to none in the United States. We understand that it is the intention of the board to hold agricultural fairs in the same lines as the State fair and other large fairs are held. This we believe will prove very popular, and we suggest holding a mid-winter fair, consisting of agricultural and dairy products, a speed program, horse, general stock and poultry show. To this could be added a display of products made in California.

A fair given at that time when California has so many visiting tourists would not only prove very popular, but would advertise the State in a way,

The three essentials of the best farm wagons are:

- The toughest wood stock thoroughly air seasoned.
- Proper construction and ironing to give the greatest possible strength.
- Light running qualities for the longest possible time.

* * *

This describes the wagons of the International Harvester Company line.

More than that, these qualities are combined in wagons of the handsomest appearance. They are built for the maximum of durability along the most pleasing lines.

**The Weber
The Columbus
The Bettendorf**

are old established makes with well known reputations for superiority.

The Weber, a strictly high-grade farm wagon, has been one of America's leading farm wagons for more than half a century. It is constructed of the very best material obtainable and is adapted to all conditions of climate and service.

The Columbus is known in all markets as a wagon well designed for general farm purposes, and constructed to meet the requirements of a good farm wagon.

The Bettendorf has an all steel front and rear gear which cannot warp, bend, rot, or shrink under any condition of climate or service, and is capable of sustaining unusual loads.

It makes little difference which of these wagons you buy. You will make sure of wagon value and wagon satisfaction in any event. You simply can't buy anything better at any price.

You should know more about these wagons than we can tell you in this small space. Call on the local agent and look them over, or write nearest general agency for our wagon pamphlets which fully describe each.

and with people that would make a lasting impression.

The novelty of a mid-winter agricultural and horse fair would prove as great an attraction to California as the Mardi-Gras is to the South, and would attract visitors from all over the country.

A CHILD'S IDEA.

Little Mabel went to visit her Aunt Sally in the country and had a lovely time, gathering eggs and feeding the chickens. When she came home she wanted her mother to get some hens for her, so they could "raise eggs," as she called it. So her mother got some hens and some nests were made, and then Mabel wanted some china eggs—the kind Aunt Sally had—in her nests. But her mother said: "Why, no dear! it isn't necessary; the hens will lay the eggs without any." "Why, how can they, Mama, without any pattern?"

Household Department

OUR FLAG.

It was born mid the throes of Free-
dom,

'Mid a leaden rain of fire,
When the souls of a troubled Na-
tion

Pressed on to a world's desire;
When patriot hearts were burdened
With weight of deadly fears,
When history paused and trembled
For the issue of those years;
When the pulse of a new-born Na-
tion

Throbb'd ever to the beat
Of martial drums—proclaiming
The rush of tramping feet.

Above a land victorious
The flag of beauty waved
Above the homes of Freedom
Above a Nation saved.
Upon its field of azure

New stars have had their birth,
As in the studded heavens

Which nightly guard the earth.
Around the storied banner

Our faith and love are twined,
Within each bosom loyal

'Tis evermore enshrined
The tireless stars above us

Whose vigils never cease
Shall watch our stars forever

In blessing and in peace.

A FOURTH OF JULY RECONCILIATION.

THE road as far as the eye could see
was dotted with little spiral
spurts of white dust. Every
spurt denoted a wagon-load of merry-
makers bound for the celebration.

"What a lot of us are going!"
laughed the summer boarder delight-
edly. She was little and nerve-worn
and pale—to go to a Fourth of July
celebration seemed such a beautiful
way to begin her long rest!

"Yes, this kind o' weather every-
body turns out," assented Mrs. Torrey
with the placid content of one who
has toiled up to the last minute and
has earned her right to enjoy herself.
"I guess everybody's on the way to
Beatty today, Jason," raising her
voice a little. Jason Torrey on the
front seat was hard of hearing,—
not from age, but the "Torrey
deafness."

"Eh? Yes, yes, I guess so. I've
seen everybody but old Uncle Sleeper,
an' he's dead."

It was hot even for the Fourth of
July. Above the dusty road flaunted
the splendid flag of the sky, unclouded
blue, guiltless of stars or stripes.
The air was full of the keen, stinging
noises of summer. Suddenly a horse's
white nose appeared abreast of the
Torrey's tailboard, then of the back
seat, then of the front. Another
wagon-load of celebraters passed by.

"Oh, look!—one, two, three—five
little girls!" counted the summer
boarder gaily. "We ought to have
some of them in here, with all our
room to let! Wait—six! I believe
there are six—"

"No, five," corrected Mrs. Torrey,
but she was not looking at the load
of little stiff-starched white dresses.
She had not looked at all.

Jason Torrey, on the front seat,
had gazed stolidly into the dust-
flecked distance.

"I didn't see anything but little
girls. They can't be going all alone."

"No, there's a man and a woman
in there somewhere," Mrs. Torrey
said dryly. "Emmeline Clove and
Horatio are both short sitters. It
runs in Emmeline's family, and I
guess Horatio's contracted it. They're
there, fast enough."

"Clove? What a nice, spicy name!
Do they live near us, Mrs. Torrey?"
The summer boarder liked to assume

part ownership in the great white
farmhouse.

"Near? Ask Jason—Jason, she
wants to know if Horatio Clove and
Emmeline live near us."

"Eh? Who's that—oh!" He turned
on his seat and regarded the two
women behind with unsmiling face.
"Oh, them—well, you tell her, 'Livia,
that they live about a hundred 'n'
fifty miles away, as near as I make
out! G'lang, Dolly, you snail! Do
you think we want to take all o' the
town's dust?"

"They live the next farm East,"
Mrs. Torrey said, dropping her voice
and twirling her cotton-gloved fin-
gers nervously. "But I guess Jason's
right—it's a good ways off from us.
I haven't spoken to Emmeline Clove
in ten years."

"Why!—why, that's a long time,
isn't it?" murmured the summer
boarder, "and living on the next
farm? Why, Mrs. Torrey, I don't un-
derstand—"

"No," the other woman sighed;
"no, you couldn't very well, without
you understood my Jason and Hor-
atio Clove. Then you'd see. There
was something happened years ago—
ten years."

The summer boarder was interest-
ed. Was there a feud right here in
drowsy, clover-sweet little Green-
acres? Yet it seemed inconceivable
there was nothing in this faded,
prosaic little woman beside her, or
in Jason Torrey's prosaic back, to
suggest anything like that.

"It seems a pity, with all those lit-
tle girls," she hazarded, hoping for
further particulars, "you seem so
fond of children, Mrs. Torrey."

The brown, plain face turned with
a quick movement that was almost
fierce in its intensity. But still
Olivia Torrey spoke cautiously; even
the "Torrey deafness" was not to be
trusted.

"Yes, it is a pity. Yes, I am fond
of children. I'm fond of Emmeline
Clove's, though I guess she don't sus-
pect it! I've never done anything
but watch 'em on the sly—I ain't ever
made a little petticoat, nor even the
edging to trim one—I ain't ever made
'em cookies or little saucer-pies—I
ain't ever had a chance to kiss 'em!"

The longing in the low, restrained
voice was pitiful. For the moment
little Mrs. Torrey's face was tragic.

"And there's five. I've lived next
to five little children, I tell you, and
ain't ever made any of 'em little
things to eat or to wear! Perhaps
you don't think that's anything—you
don't understand; how can you! It's
me that understands!"

The old farm wagon jolted on se-
dately. The sun grew even a shade
hotter and the dust thicker. In the
distance somewhere, on ahead, can-
nons boomed and bells pealed faintly.
But Olivia Torrey had forgotten what
day it was. She sat up straighter and
let her loosened tongue run on softly.

"There was one boy—five girls and
one boy. Six little children, and Ja-
son and I never had any, not any!
Things aren't evened up. When Em-
meline's little boy came, three years
ago, maybe you think it wasn't hard
for me to stay at home and make
bread and mold butter—maybe you
think I liked to!"

The summer boarder put out her
slender white hand and stroked the
cotton glove nearest her, in sudden
pity.

"No, I don't think so—I know it
was hard, you poor thing!" she mur-
mured.

"And the baby a boy, after she'd
had four girls—a little mite of a
blessed boy that I couldn't go over
there and cuddle up! Nor tell Em-
meline how she'd ought to be con-
gratulated—that was as hard as any-
thing, not to let Emmeline know.
Seemed as if I must, and nights I
laid awake thinking how. Then I
thought of a way." She smiled
rather grimly—"It wasn't much of a
way, but I did it. I never knew
whether Emmeline understood. When
I get to heaven I'm going to find out
—I'm going to ask her."

There was a little space of silence,
while they jolted steadily on. Team
after team sped by them—the boom-
ing of the cannons grew louder, and
people shouted to each other and lit-
tle patriotic boys snapped off fire-
crackers under old Dolly's heels.
She jogged along in sedate indiffer-
ence.

"And the way you thought of?—
you didn't say what the way was,"
ventured the summer boarder, after
a little.

"I hung up a flag in the top of Tor-
rey Tree—you know where Torrey
Tree is? It's a landmark, right close
to the edge of our farm. You can
see it all over the town most. I
climbed clear to the top."

"To the top of—that tree! Clear
to the top!"

"Dear, yes, that wasn't anything
much. I used to climb everything
when I was young—Emmeline and I
used to, together. If anything, she
was the best climber. I thought per-
haps she'd see that flag from her
room window, laying there in bed,
and she'd understand that it was me
congratulating her because it was a
boy. 'I'm glad it's a boy—I'm glad
it's a boy!—Horray!' was what I
hoped it would wave to Emmeline,
with 'Olivia' signed to it as plain as
writing. But I never knew. I don't
suppose I ever shall—here."

"Oh, yes, Mrs. Torrey. Oh, I'm
sure you will—I'm sure she under-
stood."

Olivia Torrey did not seem to hear.
She was gazing dreamily at the dim
blue haze of hills on the horizon.

"He died," she said quietly. "He
only lived a few months—and I never
saw him. I never knew who he
looked like, or saw his little hands,
or heard him cry. I was glad I was
away when he died. If I hadn't been
—" her gaze came back from the dis-
tance and rested on the faded, pro-
saic back of Jason Torrey, on the
front seat. They were very near the
city now and coming into the crowds
of holiday men and women and little
children. There was not time to say
much more.

"If I hadn't been," Olivia Torrey
said, "I should have walked across
that 'dead line' betwixt our farm and
theirs, and kissed Emmeline's little
dead baby. I should have—I know
I should. I've always known it. So
I'm glad I was away."

In the trig little city noise and gay
confusion reigned. Flags were flying
from nearly every house, and across
nearly every one of the pretty, broad
streets swung great banners. Little
children were tooting horns and
blowing shrill whistles and firing
crackers. Horsemen in splendid
trappings cantered about importantly,
starting the parade.

"Much as ever old Dolly got us
here in time," remarked Jason Tor-

rey, slipping stiffly over the wheel with the lines across his arm. He held out his big, brown hands to the summer boarder. She thought his sun-burned face looked good and kind—not like that of one who harbored ten-year resentments. It was hard to understand; she felt bewildered and a little out of tune with all the tumultuous merry-making. Emmeline's little dead baby was on her heart.

The parade was splendid. Beatty had never seen its like before. It trailed its slow length past the cheering crowds for an hour. Then the throngs broke up into excited, chattering groups, and elbowed one another crowdedly, hotly. Tired mothers shifted babies to their other arm, and sagged wearily with their little burdens and told each other what a beautiful time they were having. This one had been up since 3 o'clock, "getting ready;" that one had ironed three stiff-starched little best white dresses since she got up and got breakfast and churned.

"Or the cream would have spoilt. It's hot, isn't it? But it's a great success, so far. I'm having a beautiful time, ain't you?"

"Yes, indeed, I guess I am!" shifting the little burden back again. "I guess so!—I wouldn't have missed it for anything. But I wish we could find a place to set down in, out o' the sun," she added wistfully.

Everywhere it was Fourth of July—noisy, blustering, patriotic, hot Fourth of July. Everywhere flags drooped on their poles in the still air. The country was "free and independent," and everybody was glad.

"The oration comes next," explained Mrs. Torrey. "It's going to be out of doors, over there on the green. Jason's old general is going to deliver it." There was a ring of pride in her voice. Jason's share in the grizzled old veteran was not to be disputed. Had they not fought under one southern sky, one battered flag? Did it matter that one had commanded and one had followed humbly?

"Jason's looking ahead to the oration—he wants us to get good places. Of course he won't know Jason, but Jason knows him. Let's go right over—wait!" excitedly, "stop that little girl that's going by, the one with the white dress on. Don't let her get by!" She was fumbling hurriedly in one of the lunch baskets, and brought out a handful of crisp, currant-sprinkled cookies. She thrust them eagerly into the summer boarder's hand. "Give 'em to her. Put 'em right into her little hands. Tell her—no, don't tell her anything; just give 'em. They've got currants in—she'll like currant cookies."

The child sped away with her hands full of them. Her small, freckled face was smiling appreciatively, Olivia Torrey gazed after her.

"She's Emmeline's," she whispered, "the next to the youngest, and her name is"—Mrs. Torrey hesitated a little shyly—"her name is Livvy. I never knew what for, but it's Livvy."

The summer boarder turned, radiant-faced. "I know—for you!" she cried. "Emmeline named her Olivia for you!"

"I never knew," sighed Olivia Torrey. "I don't suppose I ever shall—here. Somebody'll tell me when I get to heaven. And if I find it for me"—laughing, with a sob in her throat—"then I shall ask the Lord to let me come back to Emmeline just for a minute."

"Or hang a little flag out for Emmeline to see," softly breathed the other. "Emmeline would understand."

Jason found them good places, well to the front. He himself stood a little way ahead, directly under a great ragged flag that almost touched his uncovered head. He stood up very straight and soldierly, as if on drill, and threw back his faded shoulders splendidly. Olivia gazed at him with pride.

"Don't he look like a soldier?" she whispered, "with that flag over him, and his shoulders back? And he is one—I guess I haven't told you, but Jason was wounded three times in the war. He almost lost his arm once."

The grizzled old general had lost

his. An empty sleeve was pinned smoothly across his breast. But he was hale and broad, and every inch a commander of men. He came out before them and waited, smiling, for the cheers to end. Then he began to speak.

Someone else stood under the old flag with Jason, though neither seemed conscious of the other's being there. Both were old soldiers; the other man stood straight and soldierly, too. He was shorter than Jason, and more slenderly built, but they might have marched side by side to the front—it was in their bearing. Both their faces were lifted in rapt attention to the face of the speaker.

For an hour he talked to them. He made men laugh and women cry, and little children exult in being American "citizens." It was a masterly speech the old general made, but, better still was the patriotism it preached to the patient throng that stood there in the noon heat and glare. It filled men's hearts with a thrill of country-love and country-fervor. Under the ragged old Stars and Stripes two men cheered side by side.

The flag dipped in a sudden little spurt of breeze, and its shadow swept across their faces. They felt the wind of it, and gazed upward into its faded folds. The same thoughts were in both their minds—thoughts of cannon roar and pelt of rifle balls, and a battlefield gaunt and blood-red under southern skies. The same groans of wounded men were in their ears; they were marching on to the same victory.

Suddenly Jason Torrey's eyes met the eyes of the man beside him. The cheers were still on their lips—the old battle flag was still over them. What could they do? What but the thing they did? With one impulse their brown hands shot forth and met in a splendid clasp, under the flag they both had fought for and both loved.

"Look!—oh, look, look!" cried Olivia Torrey softly. She was grasping the summer boarder's sleeve and pointing with her limp gloved fingers. "Look what's happening there—under that flag. It's Jason shaking hands with Horatio Clove—I tell you, shaking hands! They're pumping up and down! They're smiling!—Jason's smiling—Horatio is—I'm smiling!" But she was crying. "Let's cheer—you and me. No, me! I wish they'd strike up and give me a chance. They'd cheer for the general and Fourth o' July, but I'd cheer because Jason and Horatio are shaking hands! I want to cheer for Emmeline and all the little girls—I want to cheer at the top of my voice—why don't they strike up again?"

Ten minutes later Jason Torrey came striding toward his wife and the summer boarder. He had the lunch basket in his hands.

"Come," he said briskly, "Emmeline's waiting. She wants we should all eat together. We've picked out a shady place, and Horatio's gone to get some ice water for the lemonade. One o' the little shavers is squeezing the lemons. Come!"

"Am I awake? Pinch me!" laughed and sobbed little Olivia Torrey, hurrying along in Jason's broad wake. "Is it the millennium that's come?"

"No, it's Fourth of July, and I'm hungry, and it's dinner time," laughed the summer boarder happily. "I want to help that little Emmeline-girl squeeze lemonade. Hurry, hurry!"

The little Emmeline-girl was Livvy. She gave them a shy welcome, remembering the currant cookies. Emmeline was waiting with shining eyes—they were all waiting.

Afterward, toward the end of the hot, wearisome, beautiful day, the summer boarder drew Mrs. Torrey aside. She nodded toward a little girl in a crumpled, stiff-starched dress.

"I've found out,—you won't have to wait,—she said. "She's Olivia—after you."

Olivia Torrey's tired, happy face softened. "I've found out, too," she said gently, and her eyes lifted to a little flag that flaunted its stars and stripes bravely from a tiny tree top near. "Emmeline understood."

MISCELLANEOUS.

FOR SALE-SANTA MARIA DAIRY route, with or without cows; plenty of alfalfa available. No opposition. L. L. LANGLOIS, Santa Maria, Cal.

SIX HUNDRED FRUIT TRAYS FOR SALE cheap. Two by three; good condition. JOSEPH THORNDIKE, Pasadena, Cal.

A plain brown or green wall paper makes an ideal background for pictures, and the absence of pattern on walls adds immensely to the apparent size of the room.

The Produce Markets

Los Angeles Markets

LOS ANGELES, July 2, 1907.

Hot weather prevailing has caused a certain amount of timidity so that buying has been only as actual needs demand, and some of the more perishable fruits have succumbed to the weather. Prices have not been greatly affected and the tone of the market will doubtless recover as the warm weather passes.

Butter.

Butter remains the same as last week in price and no material change in the tone of the market.

Creamery extra.....55@57 1/2
Creamery first.....52 1/2
Dairy.....24

Cheese.

Cal. Young America, per lb.....19
Hland.....20
California Anchor.....18
Cal 3-lb. hand.....20
Northern, fresh.....14 1/2
Domestic Swiss.....23
Imported Swiss.....30 1/2

Eggs and Poultry.

Eggs are still weak. Large supplies are being received which, combined with the unhealthy boost given by speculators earlier, is reacting. Also it is probable that buyers are combined on knocking to break the market. A cent shading in price has resulted during the past week.

The prices given are those of the commission man to the retailer.

Eggs, local candled.....22
Eggs, case count.....20 1/2

The following are average prices which dealers pay to producers for live weight.

Hens, per lb.....11
Young roosters, per lb.....15

A FOREST OWNED BY A CITY.

The citizens of Helena, Mont., have a plan to convert the unsightly slopes of Mt. Helena, which lies just outside of the city, into a forest park. A great deal of interest has been awakened throughout the State by this project, for the people of Helena will not be the only ones to benefit by it, since it is an object lesson to cities in other parts of the country.

The city of Los Angeles, too, has its possibilities in its 3000-acre park of hill and mountain which now has some fine trees and in time will have more. May it take advantage of its opportunity to its fullest and make a rest spot which for years to come will benefit the human race.

San Francisco Markets

SAN FRANCISCO, July 2, 1907.

The market has been subject to bull and bear influences, with the bulls generally on top. The bull element is represented by the leading receivers of Eastern goods and, by keeping the local market up, they expect to advance the value of their holdings or at least to obtain more remunerative prices when the time comes for marketing them.

Fresh Fruits.

The market generally was rather quiet and easier for seasonable fruits. Prices, however, were still considered high and beyond the reach of a great many would-be consumers. Owing to the hot weather at producing points berries were "cooked," in the language of the street, and prices were correspondingly soft. Two carloads of watermelons came to two different houses.

Citrus Market

LOS ANGELES, July 2, 1907.

The warm weather touched the East and has not seriously affected the orange market and has been most helpful to the lemon market. Oranges are still selling well and the few navels at the eastern end are commanding good figures. The navels are all gone from this end and, in fact, everything excepting valencias. These are in firm fine condition and the promise now is that they will hold up their end of this most successful season.

Lemons are the favorite and the weather has put them on the upward move. The output is not as large as last year.

Shipments to date are 24,429 cars of which 2528 were lemons. Last year same date, 23,719, of which 2961 were lemons.

NEW YORK CITY, July 1.—The market is very strong and higher on oranges, very dull on grapefruit, excepting extra fine grades. Weather hot. Thirty cars sold.

The sheep shearing plant at Bak-
ersfield consists of twenty stalls each
equipped with a shearing apparatus.
One man is located at each stall,
while others have charge of the
sheep in two corrals. A runway
goes from each stall to both the
shorn and wool corral, arranged with
gates, which open into the main lanes
and are easily operated by the em-
ployees. The shearing machines are
to be operated by a twenty-five horse
power gasoline engine, and the cost of
the entire plant will be in the neigh-
borhood of \$2000. It will be com-
pleted in about two weeks.

The night has a thousand eyes,
The day but one;
Yet the light of the whole world dies
With the setting of the sun;
The mind has a thousand eyes,
The heart but one;
Yet the light of a whole world dies
When love is done!
—Christian Manhood, St. Louis.

For sprains, wrap the parts in
flannel cloth wrung out of boiling
water, cover with a dry bandage
and give the parts absolute rest for
several days.

BUYING A FARM WAGON.

If the wagon question is up with you
this season, you cannot do better than
call and have a talk with the local agent
of the International Harvester Com-
pany of America. He will call your at-
tention to three wagons sold by the
company—the Weber, the Columbus
and the Bettendorf—and you are sure
of making no mistake, no matter
which one you decide to buy.

The three I. H. C. wagons above
named are made to meet trying re-
quirements. The Weber and Columbus
are made from the toughest of wood
stock, properly air-seasoned and ironed
to give the greatest strength without
making them cumbersome or giving
them a log-wagon character. For the
Bettendorf, the gears are made of
steel. That does away with warping
and springing and is a guarantee
against breakdowns, if you want to be
prepared for extra heavy hauling or
roads rougher than the ordinary. It
is also a wagon well suited to all cli-
mates. All three are distinguished for
their light running qualities.

The local I. H. C. agent can supply
catalogues and other printed matter
describing these wagons in detail.
There is no better man for you to go to
if you want to be sure of not going
wrong when you buy your wagon.

WHY HE CRIED.

The little boy came out of the room
in which his father was tacking down
a carpet. He was crying lustily.

"Why, Tommy, what's the matter?"
asked his mother.

"P-p-papa hit h-h-his finger with the
h-h-hammer," answered Tommy.

"Well, you should not cry at a thing
like that," said his mother. "Why
didn't you laugh?"

"I-I did," sobbed Tommy.—Maga-
zine of Fun.

In a rural justice's court the defend-
ant in a case was sentenced to serve
thirty days in jail. He had known
the judge from boyhood, and addressed
him as follows:

"Bill, old boy, you're agwine ter
send me ter jail, air you?"

"That's what," replied the judge.
"Have you got anything to say ag'in
it?"

"Only this here, Bill. God help you
when I git out!"—News.

"Uncle," said the scientific youth,
don't you know that you ought to
have your drinking water boiled, so
as to kill the microbes?"

"Well," answered the old gentleman
thoughtfully. "I believe I would as
lief be an aquarium as a cemetery."

Gyer—That spinster aunt of mine is
certainly the limit.

Myer—How's that?

Gyer—I presented her with a loud
ticking clock recently and she sprink-
led the works with insect powder.

Myer—What did she do that for?

Gyer—to get rid of the ticks.

Relation between employer and em-
ployee wherever the latter prove to
be Japanese is becoming less and less
cordial on orchard and ranch over
the Northern portion of the State.

Papers over the San Joaquin val-
ley state that dairymen are complain-
ing bitterly because of lack of milk-
ers, and that the milking machine
is increasing in favor.

National Aid to Irrigation

IN AN ADDRESS before the people of Salinas, who are taking steps to secure government aid in a large irrigation system, Ex-Governor George C. Pardee said:

"I happen to know, for I had a finger in the pie, that the Reclamation people have argued and begged and pleaded with the people of certain parts of California where irrigation works would be easy and cheap, to take advantage of the government's offer. Parts of the San Joaquin and Sacramento valley have thus been laid seige to; but the efforts put forth have, in most cases, been without any results at all. The people who should have been easily

and quickly interested have hung back. The result is that other States and Territories have stepped in and taken the cake that should in part, at least, have been ours. But the Reclamation people are by no means discouraged, neither are we who, having no lands of our own to irrigate feel, nevertheless, that California's good is our good, and that, "sink or swim, live or die, survive or perish," we live for California, first, last and all the time, and that permitting nothing to discourage us, we shall continue in the good work as long as we can or it is necessary for us to do so." "Uncle Sam is desirous of seeing every American family possessed of a home."

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Treatment for Gooseberry Mildew

Which Will Save the Vines and Give
a Large Percentage of Perfect Fruit

A SUBSCRIBER in Humboldt county has sent a number of diseased gooseberries to this office with an urgent request for immediate assistance because of the fact that her gooseberry crop is being ruined by a most perplexing mildew. It forms on them making them unfit for use.

It is perhaps too late to be of assistance to our friends in Humboldt county for this season, but a remedy given at this time may be of value, in this, that it will attract attention to the trouble and people will be prepared to meet the same enemy another year. To that end we give an illustration of its appearance taken from a bulletin issued by the New York Agricultural Experiment Station, which gives a fair representation of the appearance of this diseased fruit, excepting perhaps that most of the fruit sent to this office is a darker brown in appearance than the diseased fruit in the engraving. This is because the fruit is further advanced in the disease.

Regarding this disease, we quote from the bulletin written as to conditions in New York, which would doubtless be the same in California, unless it be as to the time of the year, for we assume it might appear earlier than last of May or first of June in this State. The bulletin says:

Appearance.

"The gooseberry mildew generally makes its

Gooseberry Affected With Mildew

appearance during the last half of May or first half of June. It is first noticed as glistening, frostlike spots on the fruit on the lower part of the bush where there is usually dense shade. As the disease progresses the spots enlarge, turn dark brown and form a feltlike covering over a part, or all, of the berry. In a slight attack the disease may not injure the fruit at all, or only slightly deform it. In a bad attack the fruit has a repulsive appearance, is stunted in development and may be more or less decayed.

Will Practically Destroy Plants.

Two or three weeks after the mildew attacks the fruit it appears on the young, tender twigs, especially on their tips. If the attack is severe the new growth will be destroyed and the older growth will be considerably injured. In case of a very severe attack the fruit will be rendered worthless, and the foliage will be nearly, or entirely killed during July. As a result no fruit buds are set for the next year's crop, and the bushes are so badly weakened that they suffer from winter injury. In a few commercial plantations where little or no spraying has been done, the writer has seen the crop of fruit destroyed and the bushes practically ruined by this disease.

Concluded on Page 43

The Growing of Bulbs

Continued from Last Week

Hyacinths.

This is doubtless one of the most popular winter flowering bulbs, largely grown by florists for "forcing," but it is so universally admired, it is wanted in the border or in the window garden. These bulbs are all imported from Europe and arrive during September and are not successfully carried over, in other words get new bulbs every year. They should be planted as soon as possible, either in pots, pans or beds. The following directions should be carefully followed: Plant bulbs in loamy soil, leaf mold and well rotted manure, about equal parts with good grainage. The top of bulbs should be covered very lightly or about even with the soil, thoroughly water to settle the soil about the bulb, then these bulbs (pots or beds) should be covered with coarse litter, (leaf mold is best) to depth of six inches, or more, and kept in cool place for about two months, or until a good root growth is made and leaves are up about two inches, when they can be uncovered, and given light and more warmth. Care should be taken that a good root growth is made before giving them any light. Without this root growth you will get no flower stem. Followed with liberal use of manure water, but discontinue as soon as in full bloom. Often they are grown in glasses and are elegant ornaments. Use only single varieties as they produce finer spikes than the double, and they open better.

Fill the glasses nearly full of clear water, almost touching the base of bulb, using a little charcoal to keep water pure (water should be changed about once a week) place them in a cool dark cellar or similar place for six weeks or two months or till roots are nearly to bottom of glass, then bring to light and air, avoid drought and

sunshine. Another good way is to "transplant" the bulb after roots are made, to the aquarium, by using board or cork to keep bulb from tipping into water.

Roman Hyacinth.

This is a small flowering bulb, of similar habit to above, but is hardy outside and blooms perfectly and freely. Can be left in the ground from year to year, but best to take up every year about June or July, dry, store and replant in fall. Hardy bulb.

Iris.

There are so many species and varieties it almost requires a special article to describe. Most of them are imported during September and October. It can be planted at once and blooms during early spring. Some are evergreen such as Germanica and Kaemferi and need not be disturbed while Susana should be taken up and stored with tender bulbs.

Ixia.

Beautiful little bulb from Cape of Good Hope, large showy flowers, bulbs arrive in September, thrive without being disturbed like Freesia. Treat the same.

Jonquil.

Jonquil culture is the same as narcissus. Many people order these bulbs thinking they are ordering the Trumpet Narcissus, which is a mistake. This is a small flowering bulb of the narcissus family with same care and culture.

Lily of the Valley.

Millions of these bulbs are now annually imported from Europe and are at once placed in cold storage, and planted as wanted in 'forcing

beds" in greenhouse in high temperature and brought into flower, which operation requires only about 20 days from time it is taken out of ice to full bloomed flower. Not successfully grown outside in Southern California although in many places in Northern California is perfectly hardy.

Lilies.

Great quantities of lily bulbs are imported yearly from Bermuda and Japan. But lately it has been found many varieties thrive in California. Such varieties as Harrisii, Longiflorum and Canadensis, thriving first class. They should be taken up at least every other year, separated and replanted. These bulbs must never be dried, but if to be kept should be stored in damp sand or moss. Plant in August to February. Should be kept growing as long as possible, to perfectly ripen bulb and mature offshoots.

Montbretia.

A hardy evergreen bulb, thrives any and every where, should be divided every two years and thinned out, best time for this is September. A striking and beautiful bulb to mix with your fern bed. But if not watched will soon crowd ferns out, can be dried off and stored like fall or hardy bulbs.

Narcissus, Daffodils, Etc.

The Narcissus are divided into several classes such as Polyanthus or cluster bloomer. Those most commonly represented here are the Chinese Sacred Lily and Paper White, a pure white variety, and the most popular are the Trumpet shaped flowers both single and double with but one flower to the spike, coming in different shades of yellow and white. They are mostly im-

Deciduous Fruit Culture

CHEMICAL VALUE OF GREEN CROPS.

THE real chemical value of green manuring crops is something of an indefinite quantity in the minds of most of us and just what they are worth aside from their humus producing value, is an interesting subject. There is a vague sort of idea among some growers that these crops when grown in sufficient abundance will supplement the use of fertilizers entirely. This idea has been advanced by some of the best horticulturists in the country and it may be a correct view and results have no doubt been obtained that demonstrate the fact. Nevertheless, citrus culture for instance, in California seems to show that green crops are not alone sufficient.

Investigations at the Delaware Station have shown some interesting facts that have a bearing on the subject, applicable to our or any other sections. The idea that the roots of green manuring crops are the richest in nitrogen, is quite natural as it has been taught that the free nitrogen of the air is absorbed through the agency of nodules growing on the roots. It is also known that the nodules on the roots contain a larger percentage of nitrogen than do the roots themselves, but the tops contain a larger per cent than the roots as a whole. The following figures were obtained from the different crops in the dry-air state. Cow peas tops and roots, nitrogen 1.75 per cent and 1.40 per cent respectively. Potash, 1.27 and .76 per cent. Phosphoric acid, .45 and .73 per cent in the tops and roots respectively. Analyses of vetch show, nitrogen 3.53 and 2.19 per cent; potash 2.56 and 1.18 per cent; phosphoric acid .74 and .79 per cent in the tops and roots respectively. Alfalfa, nitrogen, 2.42 and 2.04 per cent; potash 1.42 and .48 per cent; phosphoric acid .58 per cent and .43 per cent in the tops and roots respectively.

The roots of all the above plants are mostly near the surface. The following figures are taken from the Delaware bulletin and may not stand for California conditions, still they do show their characteristic as an annual crop for green fertilizer. Cow peas had 301 pounds of roots per acre to a depth of 8 inches and in the next 4 inches but 9 pounds. Vetch had 584 pounds in the first 8 inches and 16 in the next 4 inches.

This shows that the roots really amount to very little as humus producers, but they have a very beneficial effect in opening the soil and allowing the water and fertilizer to penetrate more rapidly. They also bring the mineral fertilizers from below to the surface. This has always been considered an advantage, but we question it. We are eternally trying to devise some way of getting our commercial fertilizers as deep into the soil as possible. These two conditions are decidedly at variance, but nature is on the side of the growing plant and there is enough compensation somewhere to more than balance this disadvantage, if it is a disadvantage which assertion we do not make without reservation. The facts in the case are, that we put the fertilizer as deep into the soil as we can get it with a drill or plow and plant the green manure crops which immediately pumps all that it can assimilate, near to and above the sur-

face. At the same time the plants are drawing from the lower depths to the surface, almost the entire amount that they absorb. There is a constant flow of these elements to the surface.

It is quite commonly supposed that the nitrogen contained in leguminous plants is in a form that is immediately available when turned under, for the use of other plants. This is not proven to be true though it seems reasonable to suppose that the roots and especially the nodules are rich in available nitrogen.

It is now well known that it is not necessary for the bacteria that gather the free nitrogen from the atmosphere to have a host plant on which to grow. It is known that the soil is full of them, but their work under such conditions is slow and in many cases of little value when compared with the work done in conjunction with growing plants like legumes.

The percentages used above are of the dry matter of tops and roots weighed separately.

HINTS TO BERRY PACKERS.

Don't forget the golden rule, and do unto others as you would have them do unto you.

Don't forget that every quart of berries is picked and packed for some one to eat.

Don't forget to pick and pack them as you would like to have them if you were buying them to eat.

Don't forget that you can by a little painstaking instruction soon teach your pickers to fill and round up their boxes so they will not need repacking.

Don't forget that repacking bruises the fruit and often hurts the sale of our berries more than anything else.

Don't forget to have your pickers understand that you will pay a good cent for the picking of every good box and only a piece of a cent for a piece of a box.

Don't forget that a good, honest, attentive, generally respected lady or gentleman will make you more money working right with the pickers, seeing to it that all the boxes are properly filled, than three or four packers will at the shed, turning and returning the boxes tumbling and bruising the berries several hours after they have been picked.

Don't forget that you can often get your berries into the shade several hours sooner by this plan than you can by trying to properly fill and repack thousands of carelessly filled quarts with a lot of "jolly" high-priced packers at the shed.

Don't forget that the sooner berries are placed in the cooler after they are picked the longer they will carry.

Don't forget to try to make a good name for yourself and your products.

Don't forget, in the beginning of the season, to let your berries get ripe before picking them, but as the season advances and the weather gets warmer, pick them firmer.—W. A. Walker in N. W. Horticulturist.

RASPBERRIES TRAINED SIDEWAYS.

C. J. Anderson, Sumner, Wash., who is considered a leading intensive raspberry grower, puts a post by each hill on which a short crosspiece is nailed near the top. Last year's vines on which fruit is borne the present season are tied in such a way as to pro-

trude to one side, leaving space for the new shoots to grow straight up without interfering with the bearing canes. This method makes picking easier and the fruit can be picked more evenly as to its ripened stage.—N. W. Horticulturist.

THE BENEFITS OF IRRIGATION.

In a recent speech at Petaluma Professor Fortier, in discussing the benefits of irrigation, had the following to say concerning the Sacramento Valley:

I know that opinion is divided as to the beneficial effects of irrigation in the Sacramento Valley. But the final decision in this case does not rest with the land owners. It will eventually go to a higher tribunal. Nature itself will decide the issue. No land, however fertile, can be made to produce successive crops of grain without a change. Summer fallowing helps, but it incurs the loss of a crop every alternate year. In course of time the good effects of summer fallowing will cease. By the aid of the natural rainfall it is possible to introduce a rotation of crops which will improve the fall it is possible to introduce a rotation which will ever become general without irrigation. When we say that nature will decide the issue, we mean that the time is not far distant when the owners of the large estates will be forced to sell or to irrigate.

Men tell us that between three and four thousand millionaires own one-fifth of the wealth of the United States. Possessing so many privileges, it is comparatively easy for the rich man to add an extra million to his wealth, but difficult for the poor man to increase his scanty savings by one hundred dollars. The concentration of capital seems to be followed by a more perfect organization of labor. The men who work for corporations are joining hands for mutual aid and protection. Between these two great powers, represented by capital and labor, the only safe balance is the conservative vote of the American farmer. One of the strongest reasons, therefore, for the extension of irrigation is that it provides prosperous homes for a dense rural population—a population that is independent of both the trust magnate and the walking delegate.

I have no desire to assume the role of advocate for the cause of irrigation. Perhaps it would not be strange if a life devoted to the construction of irrigation works and the solution of problems which confront the irrigator should be biased in its favor. Nevertheless, I have tried to be conservative in all the statements made and I feel confident that the people of the irrigated portions of this State will support me when I state that irrigation makes gardens and orchards out of the desert places; it increases the yield of both field and orchard in localities where a rainless summer robs the soil of its moisture; tends to subdivide the large estates into small irrigated holdings; converts low-producing grain lands into intensively cultivated small fields; adds greatly to the number of diversified farms; lessens the imports and increases the exports of all soil products; does away with the isolated life of the farmer by the density of rural settlements; provides most of the advantages of both country and city life; and constitutes the same anchor of the State by the establishment of an ever-increasing number of prosperous farm homes.

Customer—Bring me an extra good steak, and have it very rare.

Waiter—Boss, a extra good steak in dis heah restant's allus very rare!

CROPS BETWEEN TREES.

There is no objection to raising a crop between the rows of young fruit trees provided always the crop is one which must be cultivated, "a hoed crop" to use the general term, and that the soil is of sufficient richness to supply the proper plant food to the cultivated crop without the trees suffering in consequence. For the first two or three years after the young trees are set, hoed crops may be grown among them with profit but it is always advisable to have those crops which may be removed in time to seed the space to a cover crop for the winter, this crop to be plowed under in the spring and furnish humus, to the soil. After the third year, unless the soil is of more than the average richness, it is not advisable to grow any crop in the orchard.

SOME FRUIT OUT OF THIS STATE.

To California's shipments of oranges, lemons and grapefruit, which now reach 30,000 carloads annually, Pacific Coast growers are adding thousands of cars of fruits and vegetables, a large part of which come from lands lately reclaimed from the desert by irrigation. Cantaloupes and table grapes that rival the finest hothouse products are the most rapidly developing additions to California's output. Last season's cantaloupe shipments amounted to about 600 cars, and this season it is expected 1000 cars will be shipped.

This year's shipments of deciduous fruits, which begin with cherries in May and end with grapes in November, are expected to show a decrease of about 1000 cars as compared to last year's output of 8000 carloads. The reason for this is the constantly increasing output of California canned goods, the growers preferring to sell to the canners, and the decrease of fresh fruit is more than made up by larger shipments of other fruits and vegetables. Celery growers alone near Los Angeles sent 2700 carloads to market this season.

HUMUS IN THE SOIL.

Professor Whitney, of the Bureau of Soils, says humus acts as a sponge in the soil and absorbs toxic poisons which are given off by the plant roots. However this may be, the farmer must add humus to his soils to make them produce good crops. There are several ways in which humus is increased in the soil. To make the matter clear to those who do not understand what humus is, it might be well to state that humus is the dark-colored mold left after organic matter or vegetable matter has decayed. Then in the light of this explanation farmers will understand that any organic matter turned under and allowed to decay will form humus. Barnyard manure, straw, stalks, etc., the plowing under of green growing crops, such as clover, cowpeas, rye or any crop used generally for green manuring will add humus to the soil.

The lack of organic matter is usually noticed by the soils becoming out of condition. They run together and cake after heavy rains. When such a condition occurs the farmer should spare no pains to add this highly essential part.

FRUIT AND FERTILITY.

Next to tomatoes, it has been found that strawberries make the least demand on the soil. An acre of ground producing 6000 pounds of berries will be called on to give up only eight and a half pounds of nitrogen, three pounds of phosphoric acid and ten

pounds of potash. In other words, the land will have to put only about one-tenth as much plant food into a crop of berries that it would into a crop of corn. The berries will generally sell for about ten times as much as the corn. So that for the same number of dollars of return, the soil will only have to give up about one-hundredth as much plant food.

There is nothing removed from the

plat except the fruit and this, like tomatoes, is largely water. It is necessary to pay some attention to the fertility of the soil and to occasionally apply fertilizer.

Perhaps the best material for this purpose is well rotted barnyard manure. It is necessary to have the manure well rotted so that the plant food it contains will not be scattered through too great a bulk and all the

weed seeds that it contains will be dead.

MEAN HUSBAND.

Mrs. Scrappington (in the midst of her reading)—Here is an item which says that full-grown rhinoceroses cost \$12,000 apiece.

Mr. Scrappington (meanly)—Eh-yah! And isn't it a pity that women can't wear them on their hats?—Smart Set.

Wagons for the Ranch

We make a specialty of high grade farm wagons. If there is anything in the shape of a wagon that will last as long or run as light as the old reliable Schuttler wagon we have yet to hear of it. All the weight of material put where needed, so that the wagons have and great capacity.

We have other first class makes of farm wagons—such as the Burg, the Harrison, the Winona—all good wagons which will give entire satisfaction.

Ask to see our Roller Bearing Farm Wagons—also made by the Peter Schuttler Co.—absolutely the lightest draft wagon manufactured. We have sold a number of these and they are greatly pleasing our customers.

Haul this seasons crops on a new wagon.

Saves Hours of Cleaning

Of course your wife would try to wash even the worst cream separator bowl properly twice every day. But why ask her to slave over a heavy, complicated "bucket bowl," like either

of the four on the left? Why not save her hours of cleaning every week by getting a Sharples Dairy Tubular Cream Separator with a simple, light, tubular bowl, easily cleaned in 3 minutes, like that on the right? It holds the world's record for clean skimming.

Sharples Tubular Cream Separators are different—very different—from all others. Every difference is to your advantage. Write for catalog M-260, and valuable free book "Business Dairying."

CALIFORNIA DAIRYING.

Concluded

THE pure food laws are making the foods we use better. Milk, butter, and cheese have now to be pure and of full nutritive value. The oleomargarine men welcomed this law at first, thinking they could prove the coloring matter in butter and cheese to be illegal. Custom had long demanded that yellow should be the color of butter and cheese. The Secretary of Agriculture decided that this use of harmless coloring matter could not be longer called a deception, no matter if it had at first been intended as one.

Bacterial Counts.

The next attack on the dairymen was the counting of the bacteria in the milk. This too has passed in the more enlightened places, as it really was an expensive way of showing the uncleanness that careful sanitary inspection corrects. The number of bacillia might be millions in one sample and yet not be deadly, while the milk with the lowest count might be carrying typhoid, tuberculosis or diphtheria, a very few bacteria of these being enough to do mischief.

Style.

There is a place, let us say in the moon, where the health officer has been trying to force the dairymen to conform to a certain style of wagon. One of the most conscientious of these milk dealers has been arrested for delivering milk in an old-fashioned wagon. Why? Style was lacking, for it could not be claimed that milk in sealed bottles could be affected by riding on a buck board. These things tend to make laughable the efforts to regulate the business.

Man, proud man,
Drest in a little brief authority,
Most ignorant of what he's most assur'd,
His glassy essence—like an angry ape,
Plays such fantastic tricks before high heaven
As make the angels weep!

Preservatives.

The manufacturers of preservatives made money rapidly by putting up a cheap chemical, and charging a high price for it to the dairyman. The manufacturers are the men that should have the blame, rather than the milkmen, who were often ignorant of any harm. The oily-tongued agents cajoled, lauded and assured the dairyman that the drugs were harmless.

Creamery Promoters.

California dairymen, a few years ago, were also the victims of the creamery promoter. Creameries were built where there was not enough cows in sight to support them. The dairymen took stock to half the amount of the estimated cost, the promoter put in a three thousand dollar plant and charged for it a round sum of ten thousand dollars, taking half of his pay in stock. The running expenses were borne by the dairymen who had put in all the cash or given their personal notes for it. When the creamery failed, as it was bound to do, the mortgages took the machinery and left the dismantled building. It was again used by the same promoters to fit out an-

other creamery on same plan—for a little paint made it look like new. Often the machinery was sold, three or four times, until it brought in a revenue of twenty thousand dollars and was good for more money until at last a happy accident burnt up the bankrupt creamery. Today the creamery promoters have moved to newer sections.

Building up the Soil.

The dairymen works with Nature, for he is a builder up and not a pul-der down of the fertility of the soil. The dairy brings wealth to people of small means, and it is easily handled as a family affair. I know the industry has been taken up by wealthy men as a money-making scheme and they have attempted to control the creameries but not successfully. The skimming stations of many of the large central plants are today standing idle, for whenever an attempt to under pay the dairyman has been made, he at once formed his own creamery association or else bought a separator and shipped the cream to market further away. Wherever the price is highest there the cream goes in train loads.

Educating the Dairymen.

The result of shipping cream has been a liberal education on sanitary lines to the remote dairymen. The milk and cream has to be well cared for or else it arrives an bad shape and is rejected. The premium has been put on clean stables and clean milkers. Clean milkers? Are they to be hired in your neighborhood? Not often, I fear, can they be induced to be in a sanitary condition themselves.

Milking Machines.

The milking machine is slowly coming to be a practical matter. Today, the milking machine is perfect enough to do its work when in skilled hands. Now it is down to the economical question, at present few of the users are able to reduce the forces of men needed, sufficiently to carry the interest and repairs on the machine. While the milking machine costs more than hand milking at present, it is so much cleaner that the consumer may see that milk drawn by it is worth more to him, and be willing to pay more for it. The time is surely coming when it will pay in California to produce the best milk. The womens clubs are doing work along the lines of educating the housewife in caring for the milk when it reaches the home. Really it is not surprising that the stomachs of our grandfathers and grandmothers were better than ours today. How much the ordinary refrigerator, as kept in the homes, has to answer for? The continued state of being grouchy in temper, sallow of complexion and never feeling that it is joy to be alive are often to be laid to the unsanitary condition of the refrigerator.

Better Prices.

The dairyman, as he adds to the expense by cleanliness, should combine for a price that will pay for the labor of whitewashing, clean duck suits for the milkers, sanitary pails and the carding of the cows. The dairyman today, who is ignorant and careless receives a larger return than the clean up-to-date man. Cleanli-

ness may be classed as our duty, the advanced prices as our rights; while it is well to think less about our rights than our duties in a moral sense, in a business way it may not be well to forget either. It is said that "the meek," meaning those that regard the rights of others, "shall inherit the earth;" but as the modern prophet, Elbert Hubbard, put it, in his way, the other man will have the real estate before the meek man can robate the will."

Sold Up Your Head.

The dairy in California has a great future; a country where all things grow to the greatest perfection can be made to produce as much butter per cow as in any other part of the world. When an industry reaches a high place it is carried there by the men that stand behind it. When the dairymen has ambitions, then he will come to his rights and honors. We must think the industry worthy of our best efforts and make others think well of it. Then have patience and more kindness—a little more love to sweeten life around us. Patience with the milker in his ignorance. Kindness to the gentle cows, feeding and sheltering them better. A little more love for everyone, and for ourselves as part of God's world. Living our lives in all conditions, loving and respecting ourselves in doing the work laid down before us. —Minna E. Sherman.

INJURING THE BOAR.

It seems that some one who is interested in breeding swine should call a halt on breeders who are overcrowding work on their herd boars. The hog may be hoggish, but like all other things in nature, he has his limit. It requires the breeder to exercise the best of judgment to decide when that limit is being approached, and put on the breaks. The boars should be raised, cared for and handled with skill and intelligence, with an understanding of his capacity as a breeder, in order to secure the best results.

It is a well-known fact that a boar that is overworked will produce a poorer quality of pigs during that time. He can not be expected to do his best in a condition where his resources have been drawn on too heavily.

There is no rule to be laid down that could be applied to all, as there is too much difference between animals. But in many cases too little thought and reckless handling is the cause of the failure of boars to breed.

It is my opinion that this desire upon the part of owners to overwork their breeding animals is caused from the high price or cost of the boar and their anxiety to be getting their money back. This undue pressure on the boar really kills the goose that lays the golden egg. Nature will not respond and the hog stops breeding and the wheels of money-making through him cease for the time being.

Another cause for this over-taxation of the breeding boar is the fact of dividing up the boar into a half, quarter or third interest to different breeders. The owner of an interest works him up to the last moment of his time to get all he can out of him. When he reaches his other owner he commences as quick and works as

long as his time permits, and hence comes a stoppage of breeding.

It is no inherent wrong in the animal himself, but is altogether owing to the manner of handling him as breeder and drawing upon his powers beyond his endurance and hence violating a law of nature. The blame is generally laid to the hog, whereas it should be to the handler. It is a loss to the breeder to overdo this. In the first place, because of the disappointment; in the second place, because of the discount in the quality of the pigs that are produced.

Owing to the many failures we believe that it is sufficient warning of itself to prevent these occurrences, but believe it will be good for breeders to reflect and consider this question and remedy it as they no doubt will, as they have always proven equal to the occasion heretofore

HOG CHOLERA.

Here is a man losing his hogs. Every day a few of them die. They will be seen one after another to burrow deep in the litter, shiver, as if cold, refuse their food, and next day they are ready to haul out.

His neighbors come around and offer consolation by telling him that it is not hog cholera at all, and incidentally suggesting a remedy or two, such as charcoal or sulphuric acid. Then, with their feet covered with litter contaminated with the deadly virus picked up in the pens, they cut cross lots for home and examine their own pigs to be sure that they are all right, and thus spread the infection.

A number of outbreaks have been traced to the feeding of swill from hotels; presumably, the infection is in the pork rinds of infected hogs.

Hog raising is destined to be a great industry in this State, but let us be ever on guard against this swine plague, which usually not only takes the profit but the capital invested as well.

In case the disease is suspected, dissect a few of them as soon as they die; if they have red patches on the belly, ulcers in the large intestines, the lungs inflamed, and are dying a few every day, do not hesitate, but get busy. It is a waste of time to dose them with nostrums. The most successful way seems to be to separate all the healthy hogs from the sick ones and put them in clean pens or a field. Keep on doing this. Burn the dead hogs, and disinfect the premises where they have been. By doing this, a large percentage of them may be saved.

The other method consists in standing around, when not hauling off dead pigs, and experimenting with sundry specifics.

I can almost hear some man, with comments not altogether complimentary, suggests that he at one time tried a certain hog cholera cure and only lost twenty-five per cent. of his hogs, and had he only used it a little sooner, he could have saved them all. Hog cholera is a germ disease deadly in the extreme. All kinds of remedies reasonable, and those foolish in the extreme, have been tried, but the average death loss is something like ninety per cent. Brother, do not be deceived; your loss is likely to be one hundred per cent. next time in spite of your remedy. If the disease is with you, get busy and clean up. One ounce of prevention is worth more than all the cures ever heard of for hog cholera.

Runs in Oil

A cream separator has parts that run at high speed. To work smoothly and easily they have to be fitted together very exactly and yet unless thoroughly oiled they will grind and wear away. Hence the need of proper and ample oiling. In the U. S. Separator, oiling is done automatically and perfectly. The cut gives you an idea of the extremely simple arrangement.

Notice that part of the frame has been broken away, showing the driving gears, and the bowl which turns fastest. The sight feed oil cup automatically supplies the bearing that steadies the bowl; then that oil runs down into the gear chamber, where you see the little hollow. Once the machine is well oiled, this hollow gathers the surplus and keeps full. Now when you turn the gears in the improved

U.S. CREAM SEPARATOR

the teeth of the lowest gear run through this pool of oil and throw it up in a spray just as a buggy wheel throws water when you drive through a puddle. In this simple, economical way, the teeth of the gears above, the spiral teeth on the spindle of the bowl, and the simple, one-ball bearing at the bottom end of the spindle on which the bowl spins, — are ALL kept wet with oil when running and that's why (combined with proper construction and the best materials) there is so little friction to a U. S., and why it is the longest-wearing and lightest-running separator made.

Here we can only give you an idea of the superior oiling device, and can't even mention the many other advantages of the U. S. But we'll send you free a copy of our big, new separator catalogue that tells all about the U. S. Just say, "Send catalogue number D 20," and write us now while you think of it. Use a postal if it's handiest, or send a letter, addressing

GIVE BLACKBERRIES ROOM.

A WRITER in Rural New Yorker gives his ideas of the proper space between blackberry rows, and his opinion is based on a close study of the habit of growth of this fruit. He says:

"In my opinion many of our fruit-bearing plants are deprived of sufficient room. By severe pruning and constant mangling of the roots with plow and cultivator they can be kept small, but at any time when they have an opportunity they will occupy a much larger space. The roots of a blackberry will only have to grow four feet to reach its next neighbor's roots. I have had them make that much growth the first year from a root cutting. We must consider that while the canes of the blackberry are biennial the roots are perennial. Anyone who has ever plowed an old blackberry plantation knows that every inch of the ground is occupied. This is the case whether the plants were set close or far apart. In the case of the girl on the farm there is this additional reason for giving them more room: She will do most of the picking and perhaps all the pruning, and with her clothing she needs more room to get among them. There was nothing said about summer pruning and we all know that a blackberry bush left to itself after the first year will send out laterals even more than four feet sometimes. In that case they would touch. Half of that growth cut off after the fall of the leaf would leave a four-foot space, but the fruiting branches would reduce this to three feet or less. A successful grower who told me that the blackberry was the greatest mortgage lifter he knew, said that if he planted any more they would be 10x10 feet. In setting blackberries so far apart the plant is the unit, not the row. Suckers will come up so that each hill becomes a small plantation."

"Raspberries are supposed to require less room than do blackberries. Many years ago I planted about an acre, with the rows ten feet apart, thinking I could raise a wide row of strawberry plants in each space. The second year the laterals reached from row to row. In the early spring they were cut back severely, and the result was that the fruit stems were from 20 to 30 inches long. The crop was immense. Two bushels were picked from one side of a row 13 rods in length."

THE CACOEZELLE SQUASH.

This new addition to our new supply of vegetables is a most excellent one. It supplies the place of the ordinary summer squash and the eggplant and is far better than either. A half dozen hills will supply an ordinary family all through the season. If planted now it will begin to bear on some of the first days of September and continue until frost comes, when the squash can be picked and stored away in a cool but not too dry a place. Under favorable conditions they remain in good condition for three months. They may be stewed like the common summer squash with olive oil, salt and pepper; or fried as the eggplant after first being dipped in an egg batter. A half a squash can be used at a time, the remainder will keep perfectly fresh for three to five days. There is no waste as they do not require peeling, nor do

they need soaking out as do the eggplant. This squash must be picked while green or during the time it will yield to pressure.—J. C. O.

THE FOOD OF THE MOLE.

Professor Byche, of the University of Kansas, who has lately made a careful inspection of the stomachs of a large number of moles, reports that their diet consisted of earthworms, 42.3 per cent; ground beetles, 27.7 per cent; grubs 22.8 per cent; vegetable matter, 3.7 per cent and insect eggs, 7.3 per cent. As a result of his investigations he contends that the mole is a friend rather than an enemy of the lawn keeper and gardener, his only fault being the somewhat unsightly ridges which he now and then makes in his travels.

HOW TO KILL SLUGS.

The so-called slugs that skeletonize the leaves of many plants during the summer are all comparatively easy to destroy.

The Ornamental Garden

TIMELY FLOWER GARDEN HINTS.

THE next two months constitute a period of only moderate activity in gardens hereabouts, writes Sidney Hockridge to the Redlands Facts. An important thing just at this time is the collection and laying aside of seeds for sowing by and by. Provide some paper bags, or, what is better, stoppered bottles or tin boxes with lids. All varieties must be carefully marked. To neglect this will result in endless confusion. Such seeds as poppies are gathered when the capsules become dry. It is not necessary to pull them out; one hundred of these capsules will yield perhaps one-quarter of an ounce of seeds. This will serve as a guide for the quantity necessary to sow your plot next season. About the city are many gay patches of Booster poppies. If those having them pick the seeds carefully for the next few days there will be enough to greatly extend the poppy idea next year, besides leaving an abundance for the places where they are growing now.

The delicate Shirley poppies appear to have done the best. I have seen some very pretty displays of crimped pink, white, red and bordered ones. The gory tupil poppies appear to have fallen "where they had not much earth" and except at West Redlands very few of these are to be seen. In a few cases the coarse, ungainly double opium poppies are seen growing on the sidewalks. This should be relegated to the shrubberies or sown in broad masses. It is not adapted to the streets and does not look well there.

Besides the poppies many other flowers will be found to have an abundance of seeds at this time: Nasturtiums, scarlet fox, pansies, cornflowers, snapdragons, soapflower, gailardies, calliopsis, coryopsis, sweet peas, etc.

These home-saved seeds are superior, for you may read on the packets of all dealers that he gives no warranty, "express or implied;" and while the home-saved article will not, unless you are careful to mark the flower, which may be of aristocratic lineage, you will find that they are of recent date.

As the slugs devour the surface tissue of the leaves in each case, they may be killed by a thorough application of any of the arsenical poisons such as Paris green, London purple or arsenate of lead. Upon low plants it is equally as well to mix the dry poisons in twenty times their own weight of common flour and then dust them upon the plants through a cheesecloth sack held in the hand.

In the case of the fruits, especially cherries, where it is not safe to use the above poisons, white hellebore powder may be used instead. If applied as a spray, put three ounces of the powder in one gallon of water; as a dust, it may be used without dilution in a cheesecloth sack and a light application made. The best time to apply the hellebore is towards evening.

The slugs can be removed from cherry, pear and plum trees by thoroughly sifting fine road dust, or freshly slacked lime over the foliage in the middle of a warm day, when the slugs are upon the upper side of the leaves.

Begin in time, be thorough, and do not let the slugs destroy your trees or roses.—C. P. Gillette, Colorado Agriculturist College.

When cutting down marguerites and geraniums after flowering, be careful to leave the cup tops to lie among the stumps for a week or so; this is to prevent sun burning. Often if this is not done the plants become scorched and die out. All plants and trees after severe cutting back should be watered sparingly until the new growth begins.

CALIFORNIA PRIVET.

One of the best plants for making an ornamental hedge and which has been grown around Denver for the last quarter of a century is the one known as the California privet. It is really a Japanese plant, but coming east by the way of California, it got to be called California privet. It is not a thorny plant like the barberry and other hedge material and can be used as a boundary line or for screening purposes. It has large, bright green leaves, which are evergreen in sheltered places. With this it has quick growth and it is these good points which recommend it as hedge plant. Years ago the common privet was used for hedges, but it has rather small, dull green leaves, which do not remain on the twigs through the winter and so in time it fell into disrepute. Planted in but fair soil the California privet makes a good hedge in three years. It is like many another shrub in that it inclines to grow tall and as this is not what is desired in a hedge plant it needs watching at first so that a thick, broad base may be produced. It is easily raised from cuttings made from dormant shoots which must be planted in early spring and irrigated persistently throughout the summer.—Field and Farm.

No water plant is more attractive than the nasturtium. If thrifty slips are cut from the plants and placed in a glass vase, a network of roots will soon be filling the vase. Put pieces of charcoal in the glass, keep in a warm room, add water as it evaporates and soon the bloom will be almost unceasing.

If you have a jardiniere of ferns be sure to give them plenty of water. A fern that has become thoroughly dry once or twice is practically ruined; at least it will never have the same old strength again.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

ed Mites.

My hens insist on leaving the nests, others sit on edge of nest box. They are weak and combs are very pale. Do you suppose the warm weather is the cause?—G. B., Fresno.

Red mites are causing the trouble. Get rid of the mites or they will get rid of the hens. Clean up your nests; use paint or spray with lice killer and kerosene emulsion.

odder.

Enclosed find a sample of a weed or vine growing in my alfalfa patch. It twines itself around the stalk of the alfalfa. It is on the increase and seems to hinder growth of alfalfa. Will you kindly advise what it is, and how I can destroy it from further seeming damage?—S. S. B., Corning.

This is nothing more nor less than the perplexing pest, dodder. It is a parasite which lives on the alfalfa and other plants. Its seed germinate in the ground, but the plant must have another, or host plant to attach to, to grow and mature seed. It may have been introduced with your alfalfa seed or possibly with irrigating water from the mountains, more probably, the former. If it appears in spots only, pile straw over the affected spots and burn. If this kills the alfalfa it may be reseeded later with clean seed. The seed is like alfalfa seed only much smaller. A writer in the Cultivator recently suggested that a covering of dirt over the affected spots would smother the dodder seed and yet permit the alfalfa to come up through.

Fungus Affected Leaves.

I send under separate cover leaves and twigs from my Yellow Egg and Green Gage plums. Can you tell me the trouble? The trees are 4 or 5 years old, on white ash land well drained and no hard pan. Peach trees in the same row as the plums are doing finely at the same age. All the trees were sprayed twice with Bordeaux 5-5-40, in November and February. No signs of root knot or borers. Trees afflicted last year died this season and more afflicted this year. Trees are on Myrobalan roots.

I have taken the best of care of this orchard.—K. V. L., Fresno.

These leaves were referred to Mr. Mills and he answers: "The plum leaves are affected by some fungus that resembles Shot-hole somewhat, but still there seems to be a difference. Bordeaux mixture is the medicine for the trouble and should be used in the winter. It is useless to use it at this stage. The fungus has done its work and has passed the fruiting period."

We will endeavor to get further information and ask any subscriber who can give light on the subject to write us at once.

Squash Bugs.

Can you give any remedy for the destruction of Stinking, or Squash Beetles? They are very thick on my melon vines. Last year they killed all my pumpkins.

My way is to turn up the vine, shake them onto the ground, make a hole in the ground, rake them in and bury them. It is a tedious job, and injures the vine some unless handled with care. I wish you could recommend a better one.—J. C., Atwater.

This question has been answered in these columns and we can only repeat: Use Paris Green on vines affected and protect young vines with hoops over which are stretched netting.

Fall Potatoes.

I wish information about raising a crop of fall potatoes in this valley. Kindly give method of raising, cultivation, etc. Can seed be used raised from Burbank variety planted in the spring and dug in July?—W. F. G. Lankershim.

See Mr. Lobingier's article on page 9 of last week's Cultivator. Seed grown this spring will be all right but be sure that it is well ripened.

Diseases of Animals.

Will you please tell me where I can procure a book on hog diseases, and cure for same? In fact, disease of stock of any kind. Would like to get hold of a good book that would be a guide for diseases of all kinds of stock.—J. M.

Write the Department of Agriculture, Bureau of Animal Industry, Washington, D. C., for "Diseases of the Horse" and "Diseases of Cattle." We do not think the Department has ever issued one on the hog. Indiana has, however, which may possibly be had by writing Indiana Department of Agriculture, Indianapolis, Ind., for "Diseases of the Hog."

Sweet Peas and Fertility.

Being a city bred woman with no knowledge of gardening, and a great longing for such knowledge, I accept the invitation extended by the Cultivator to subscribers. Hence this letter. I have read of ranchers planting peas in their orchards to enrich the soil by drawing nitrogen from the atmosphere. I should like to know if sweet peas have the same power. And will the soil where they have been grown be better for carnations than soil enriched only by stable manure?

I have but a small plot for flowers and should like to know how to manage it to get the best results from different flowers. Do carnations do well on the same plot year after year? When is the proper season to fertilize callas, carnations and violets? And the best fertilizer?—L. C. S., Lemon Grove.

Probably the best fertilizer of all is well rotted stable manure. In a garden where its cost is a comparatively small matter you will probably find no superior to it. In large orchards where the question of fertilizers is serious, the use of green manuring crops have been a great relief and in any case have given greatly improved mechanical condition of the soil, and, as well have increased its fertility. Read Mr. Mills article on page 28, this issue.

Now your sweet peas may possibly not impoverish the soil as most other crops and even may add slightly to actual fertility if spaded under, tops and all, and allowed to decay, but don't for a moment think it would equal the application of good stable manure. However, be careful and not apply manure too heavily close around young plants. Beds which you will plant this fall or a few months hence, if not now occupied, can be covered with manure, then spaded in deeply. It will improve it greatly for later working. Also use fine manure for mulch during these warm, drying days.

Carnations will do well in same plot year after year if soil is kept in good condition by fertilizers. This can be done in a garden, but cannot always in field crops, hence "rotation" of crops.

Callas are resting now but a little later on fertilize and water heavily for winter bloom. Carnations and violets may be well mulched now and given heavier fertilizer later so it will be well worked into the soil before the stronger growing period.

CONSISTENT PRICING

We mark all our goods in plain figures and as low as it is possible to sell good reliable qualities. The quality regulates the price and regardless of whether you choose from the most inexpensive lines or the very finest pieces, the values will always be consistent.

Our stock is the largest and finest in the west and includes everything you could wish for in furniture, carpets or draperies.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

ABOUT "GREEN LADY BUGS."

AS USUAL, at this season we are in receipt of numerous complaints concerning damage being done to squash and melon vines and to fruit and flowers by "green ladybugs." It is unfortunate that so many people, with little sense of discernment, will insist in upon giving the name "lady-bug" to this greenish-yellow pest. The lady-bird, or as many call it the "lady-bug" is in all its phases the friend of the agriculturist, and never his enemy. It is true that there are exceptions to this, as to all rules, but the exception is so rare that we are justified in ignoring it. This green bug on the contrary is in all its phases injurious. The proper name of this pest is *Diabrotica*, and we have two species on this coast which are destructive: the *Diabrotica vittata*, a greenish-yellow beetle with two black stripes on the wingcovers, and which is the one especially destructive to squash, melons cucumbers, and other members of the same family. The other is somewhat larger, is greenish-yellow and has six black spots on each wing cover. This is the *Diabrotica soror*. This is a very serious pest to the fruit grower, as it burrows into ripe fruit; peaches, apricots and cherries, frequently being seriously injured by its depredations. It is also a very severe pest to many flowers, roses, chrysanthemums, and many others suffering greatly from it. It has a habit of burrowing into the heart of the blossom and destroying the petals and so rendering the flower useless.

These insects are very different in structure and color to ladybirds, and do not resemble them in any respect except in size, and misscalling them ladybirds leads many people to destroy real ladybirds under the impression that they are the injurious species, thus destroying their best friends because they have unfortunately been misnamed.

The striped cucumber beetle can best be checked by preventive means, as it is difficult to control it when the plants are grown and it is in full possession. Removing and destroying all vines as soon as the fruit has been gathered will destroy many of the larvae and eggs, which may still be on the roots. Young plants should be covered with a piece of mosquito netting stretched on a frame, two halves of an old barrel hoop crossed, answer the purpose as well as anything. This will keep out the insects until the plants are far enough along to resist them. The Paris green spray will destroy them if they are destructive later.

For the *Diabrotica soror*, the species which does damage to fruit and flowers, the only remedy is hand-picking. Paris green would be effective, but they appear at the time when such a remedy cannot be used, as the fruit is ripe and the flowers at their best. Jarring the plants and trees which are infested by them, in the early morning, while the insects are inactive, will cause them to drop, and if a sheet is held under the plant upon which they can fall, numbers may be captured and their depredations somewhat lessened.

FIGHTING PLANT LICE.

Among the worst pests of garden, farm and orchard, the aphids must be included as well toward the front of the list, if it does not head it. There is hardly any form of vegetation which is not attacked by this pest, in some

one of its protean forms. There are scores of different species, some of which confine themselves to one food plant and some of which, less fastidious but equally destructive, attack a whole class. Among those which do the greatest damage to the garden are the cabbage and melon aphids. At the present time great complaints are being made by the melon growers of Coachella and sections of Imperial valley, to the effect that their vines are being destroyed and their crops ruined by the pest. It is here that the ladybirds prove their usefulness to the agriculturist, for as soon as they become established among the aphids the latter soon begins to disappear, but much damage can be done before the ladybirds become established and at such times a remedy is needed. About the best thing that can be done for them is to spray the plants thoroughly with a kerosene emulsion, or with one pound of whale oil soap dissolved in eight gallons of water. As many of the aphids find lodgment on the under side of the leaves, it is necessary to have a sprayer with a nozzle that can be turned under.

END OF ARMY WORM.

The army worm season is now about over and all the damage has been done for the present. It is fortunate that these pests do not, as a rule, make their appearance in the same locations two seasons in succession and while they may possibly appear again, it is reasonably certain that they will not again trouble those sections where they were bad this year. The army worm is a cut worm, and passes its days underground coming out at night to feed, so that these insects may exist in enormous numbers unsuspected until they are driven out by shortage of food to seek new fields. It is then they assume the army habit and march forward in devastating hordes. Trapping them in trenches, with perpendicular sides which they cannot climb, drenching them with kerosene emulsion or spraying their feeding places with the Paris green have been found the most effective means of checking them.

REMEDY FOR CHERRY SLUGS.

The cherry slug has now appeared in destructive quantities and in some sections is doing much damage in destroying the foliage of the cherry trees. This slug is the larva of a saw fly, the *Ediocampa cerasi*, and is very easily handled, a spray of an ounce of hellebore in two gallons of water will destroy many of them, or the tree may be dusted with air-slaked lime, and even common road dust will check them. The insect is covered with a slime which is necessary for its life. If it is dusted this slime is dried up and the slug falls from the tree and perishes.

PEAR BLIGHT CONDITIONS.

Some cases of pear blight are reported from the pear sections of the upper country, but these are neither so numerous nor so severe as in former years, and it is evident that the work which has been done in the past against this most destructive of tree diseases, is accomplishing good results. The pear growers have been fully awakened to the necessity of doing something if they would save their trees and their crops and there are now none recalcitrant, all being willing to co-operate with the experts who have been training them for several years past. The blight will always be with us, but we have learned to fight it and are keeping it in check. Those who have pear orchards this year are getting both a good crop and good prices and have come to the conclusion that it pays to fight pear blight.

With the Citrus Growers

AN INTERESTING EXPERIMENT.

AN East Highlands orange grower hearing of a man planting his Moorpark apricot orchard to alfalfa as it bore no fruit and wanted to use the land and water for something that would bring in some money and to his surprise had abundant crops of apricots for a few years at least, thought he would try the experiment on his orange trees that are about ten years old. He sowed part of his orchard last fall and part of it in February. He now has a growth about a foot high that is in bloom. This is to be mowed, and left on the ground, the same to be done with the following crops. Part of the grove has hardpan near the surface and on this the growth is small and the trees have to be irrigated about once a week during the hot weather while the trees on the better soil require it about once in two weeks. The trees have a good color and are loaded with fruit, in fact, part of the orchard, that from which the fruit was picked early in the winter, will either have to be propped or some of the fruit will have to be thinned. The neighbors are shaking their heads at this new kind of treatment and the experimenter is not at all sure of his ground. He is fortunate in having a good supply of water from a well on the place and whenever he wants water it is simply a case of turning on the electricity. Should the experiment prove to be too expensive, it is his intention to plow the alfalfa under at once. He will plow it under in February in any event. This experiment is being watched with much interest and readers of the Cultivator will be able to get the exact facts at the end of the experiment.

EFFECT OF EARLY PICKING.

It is generally supposed that an orange tree will not require extra fertilizing when it is carrying a ripe crop and setting a new one. The supposition is that the ripe fruit makes no draught on the tree other than a certain amount of moisture that is required to keep the fruit in good condition. Some growers dispute this point, saying that the fruit grows after it ripens. This is without doubt true but it does not give any clue as to the actual effect of the holding over of the mature fruit, on the setting of the new crop. It is known that Valencias have a habit of bearing heavy and light crops during alternate years. The theory advanced is, that the trees must have a rest after carrying two crops at the same time through almost two years. The theory is right as is proven by the experience of apple growers all over the country, still there is a difference between the two cases. The apple crop matures and is gone before another comes on. When the Navel orange is left on the tree till after the new crop is set, it places it in the same class as the Valencia. The only sure evidence that we can get as to the results, is to make actual tests in the orchard. We recently observed a case where the fruit was picked early in the season from part of the trees and from the balance of the orchard the fruit was not picked till the first of June. The section that was picked early has a full crop and the late picked portion has about half as much fruit per tree. One or two instances do not make conclusive evidence, but they go toward making evidence.

FLORIDA ORANGES AND GRAPE-FRUIT.

It does not surprise F. S. & H. to learn that the Florida citrus fruit crop will be very light this year. The editor left that State April 10, and at that time but few of the trees were in bloom, more than a month late, and nothing to indicate that much bloom would appear later. The cause was a long protracted drouth, unbroken until May. In the interior of the State many fruit trees, very many orchards, in fact, were leafless in February from drouth, and many trees were doubtless dead, for a leafless citrus fruit tree is an unnatural condition and therefore indicates that it has been subjected to a severe drain upon its vitality. It is predicted that there cannot be more than half a crop this year, which spells disaster to the State, the fruit interest is so large there. Lovers of oranges and grapefruit will regret this shortage, for, without question, the Florida fruits named are the best that grow.

SUBIRRIGATION IN FLORIDA.

In the Florida Agriculturist we note that Florida orchardists are preparing to lay "porous terra cotta pipes" underground for subirrigation. This will recall to Californians many experiments in subirrigation about ten or fifteen years ago. Everyone more or less expensive and every one, we believe, a total failure.

Florida is now trying it, and apparently enthusiastically, for we note the quotation in the paper:

"The underground pipe method is the nearest approach to perfection possible. The labor of installing is simple, the pipes cover the field with perfect uniformity and are forever away from the reach of the plow, while every drop of the water is applied directly to the roots of tree and plant, and none of it escapes into the air. The supply tank need not be so high, saving much of the labor and cost of pumping. A few iron pipes convey the water to the opening heads of the underground pipes, a riser with a fifty-foot length of cheap rubber hose will feed the pipes for a breadth of a hundred feet, and a child can attend to the whole business of irrigation. The supply is steady and sufficient and the ground is always kept in the best possible condition, as is attested in many sections where the terra cotta pipes are employed in connection with artesian wells.

"For orange groves a line of pipe on each side of the row of trees, say at a distance of five or six feet, is sufficient. By this means the trees can be stimulated during the blooming and growing seasons and allowed to become dormant during the severer portion of the winter. It is a fair estimate to say that the best crops can be increased fifty per cent and the average crop doubled, the trees can be brought to uniform excellent condition and made to produce twice the amount of bearing wood each summer for next year's fruit. There is scarcely a limit to the improvement that can be brought about in the average grove by the judicious application of water and fertilizer. With this combination it is just as easy to have ten boxes per tree as eight, twenty as twelve."

Mistress—Have you any recommendation from your last place?

Applicant—Yes'm, I got three months off fer good behavior!

WHITE FLY AND OUR CLIMATE.

At the present time the all absorbing topic among orchardists, especially those in the citrus sections is the White Fly. We have been assured by an eminent authority in Washington that the White Fly would not live in the dry climate of California, and this reminds us of the story of a fellow who had been arrested for some minor offence. He was behind the bars and sent for an attorney to help him out. After explaining the case to the attorney, the latter exclaimed, "Why, they can't put you in jail for that!" "Yes," answered the prisoner, "but I am here." It is quite probable that, theoretically, the White Fly will not stand our glorious climate, but it is here. We have heard this story of climate in relation to every pest that has ever found lodgment among us. Our climate is of such beneficial character that it is good for all good things and bad for all bad ones, but when we rely too much on it, we always discover that it is also equally good for the bad. The fact is, that wherever the food plant of any insect will live there that insect will thrive. The climate that it had for the food plant is equally bad for the insect which attacks it, and vice versa.

PARASITES AND FUMIGATION.

I came across an item in a Monrovia paper stating that it would cost \$40,000 to fumigate the trees in that section. The writer then naively adds—

"Although the scutellista has saved the shade of pepper trees along the streets in many Southern California towns to the public, it has not done what was expected of it in the orange and lemon orchards. However, several new scale parasites are being experimented with, and it is hoped that they will do the work which the scutellista has failed to do."

What would have become of the parasites had the pepper trees been fumigated too? There has never yet been discovered a fumigation-proof parasite, one that would accommodat- ingly remain alive and go on with

its good work while its host was being poisoned with hydro-cyanic and acid gas; and it is dollars to dough-nuts that the writer will never live to see a "parasite which will do what the Scutellista has failed to do" so long as it is periodically poisoned off.

HE PROBABLY KNEW.

"Pa," asked little Willie Underthum, "what does a man's 'better half' mean?"

"Usually, my son," replied Mr. Underthum, "she means just what she says."

LOVED AND LOST.

"He loved and lost."
"But I thought he won her?"
"So he did; but three weeks after they were married she lost her fortune."

Gold Medal Citrus Trees

Are fully described in our treatise of Citrus Culture, which is a trifle the best thing of its kind ever published. Contains about 50,000 words and 100 illustrations telling about oranges and lemons from the seed bed to the bearing orchard. Price 25 cents. Remember we are the largest producers of Citrus Trees in the world and stand ready to serve you with the finest nursery stock that can be grown. Correspondence invited.

NATIONAL IRRIGATION CONGRESS.

Very general interest is being manifested in the Fifteenth Annual Irrigation Congress, which will be held at Sacramento, September 2, 1907. Every effort is being made to promote this Congress into one of the most important and valuable sessions ever held. The plans include an interstate exposition of irrigated lands and products of forestry. The Congress is composed of delegates from farmers' clubs, irrigation societies, chambers of commerce, and other organized commercial bodies. It meets annually. Its purpose is to promote and develop wise and beneficial national irrigation and forestry policies, and discuss practical details of irrigation and forestry. Special railway rates have been requested for passenger and freight transportation.

GROWING EUCALYPTUS.

Within the next decade we shall witness tens of thousands of acres of land in California planted to Eucalyptus for fuel and railroad ties. The trees require to be watered for the first three years, in the dry season, and cultivated regularly, after that it is agreed they will take care of themselves from what water they naturally receive.

The Santa Fe railway company is now engaged in planting in San Diego county a tract of 9000 acres. The first year 700 acres are to be planted, the second year 700 and so on until the entire tract is covered, taking about twelve years to complete the work.

The plants are seedlings, and they are set close

together, thus insuring straight and perfect trunks without branches. In five years, the little forest will be thinned by cutting out some of the trees for fence posts, leaving the others to grow into the timber. Fifteen years' growth will give a tree that will yield six ties. It is calculated, by this method of cultivation, that 700 acres will yield 2,500,000 ties at the end of fifteen years.

Eucalyptus trees four years old make good fence posts, and the limbs can be cut up for fire wood.

Every farmer in this State ought to have a double row of them around his land and along his cross fences. It is true they take some strength from the land, but they return in wood and fence posts, a good deal more than they take away from the land. Then too, they add very much to the beauty of a farm. In the Northern and Central portions of the State a good deal more attention is being given to the growing of Eucalyptus than in Southern California.

Southern California farmers ought to be taking notice of this fact.

IRRIGATION AND NATIONAL PROSPERITY.

The prosperity of the people of the United States depends more largely upon agricultural production than upon any other factor. It is perhaps not too much to say that our prosperity depends more upon this than upon all other factors. Agricultural production has increased steadily especially during the last few years when it has more than kept pace with the increase in population. Maintenance of the present prosperous conditions depends no doubt upon many elements, the relative value of which it would be difficult to determine, but no one will deny that among all of these, agriculture holds the place of first importance. Any movement, therefore, having for its object the maintenance of the steady increase in agricultural production is a movement in the direction of continued National prosperity. Such is the irrigation movement. The increase of agricultural production in the past has been largely due to extension of the cultivated area by the settlement of the West. Lands adapted to ordinary agriculture are no longer available in large areas, and therefore, increase of production in the future must depend upon a larger capacity per acre with irrigation an important element therein, and upon the extension of the area farmed by the irrigation of lands now arid or semi-arid.—Wednesday Press.

The National Irrigation Congress which meets in Sacramento in September will be the means of awakening added interest to the importance of this great subject in California. The Press well says: "The prosperity of the people of the United States depends more largely upon agriculture than any other factor."

TARDY RECOGNITION.

"By some unaccountable oversight the word "orange" has never appeared in a California State Fair premium list until this year," says the Sacramento Wednesday Press. "Tardy amends are made, however, in the list for 1907 by including liberal cash prizes, besides medals and diplomas, for all kinds of citrus fruits, from the succulent orange to the popular citron of commerce."

BULB GROWING.

Continued from First Page

ported from Europe and arrive in September when they can be planted or held till January and February for later flowering. There are hundreds of thousands of these imported every year by florists for "forcing." The kinds in most demand are Paper White and of the Daffodils or Trumpet Flowered, The Emperor, Golden Spur, Empress and Trumpet Major are the most popular. The Polyanthus type thrives exceedingly well in this climate but the Trumpet class seems to degenerate rather than hold its own, especially so with the double forms, which are worthless after the first year. The single forms as Emperor do very well carded and new stock procured. These bulbs for two or three years when they should be dis-succed much better if taken up each spring, after dying down and stored as directed for hardy bulbs, and again planted out in fall at different intervals to continue blooming period.

Nerine, or Spider Lily.

The Japanese variety, Licoris Radiata is among

the finest for hardy border. Blooms in August, without leaves which die down in May.

Ornithogalum—Star of Bethlehem.

A very popular bulb with culture same as Montbretia.

Oxalis.

Oxalis are fine bulbs for the border or hanging baskets thriving most anywhere. Should be planted deep, say three inches. Can be left for years without further care, or can be taken up and thinned out. Best time is May and June as they are mostly dormant at this time.

Richardia, "Calla Lily."

Our common Calla needs no description. It can be left for three years without injury, best to dig during June, thoroughly dry and transplant. The new Yellow Calla, "R. Elliotiana" with golden yellow flowers is admired by all, a summer grower should be dug in fall, stored as tender bulbs, and planted in spring, likes heat, water, and sun. It is a close relative of the old "Spotted Leaf Calla." R. Macullata.

Scilla, "Squill."

Beautiful spring blooming and hardy, belonging to the Gladiolus family, should be planted early in fall, about two inches deep and thrives best undisturbed.

Sparaxis, "African Harlequin Flower."

Dwarf Bulbous plants, flowering in rich and beautiful colorings of yellow, white, red, and violet. They are more compact and dwarfed than the Ixias. Same treatment as for Freesias.

Spiraea, "Japonica (Astilbe.)"

These arrive from Europe during November and December and can be planted at once or as desired should be kept somewhat damp all the time. They are a fine pot plant for Easter. They require lots of water and if planted in pots should be set in basin of water and kept constantly wet. They also thrive splendidly in the shady border or "fern bed." They will die down on approach of summer when if in pots, can be set away in a damp place covered with litter to keep from drying till ready to plant again.

Tigridia, "Peacock Flower."

"Shell Flower," a very hardy bulb thrives in most any soil, should be dug in fall and stored, hardy or half hardy. They bloom all summer and are among our best bulbs for flowers.

Tuberose.

An old favorite, perfectly hardy and blooms most all summer, and late in fall. Bulbs are best to be taken up during December or January and divided and reset or can be stored as hardy bulbs. Can keep for months in dry state, mostly grown now in Georgia and shipped to our coast in January. They succeed best in light soil with plenty of water. California grown bulbs are not as good as a rule as Georgia grown on account of poor attention in their growth.

Tulips.

An old-time favorite among the earliest flowering bulbs and are annually imported from Europe. Will not thrive over one year in California and new stock should be obtained. Avoid early varieties as these are practically useless. A new seed firm in Los Angeles claim to have a Tulip that is a perfect success in this climate throwing stems twelve to fourteen inches, discovered by them in their travels and dealings among florists on this coast.

Vallota Purpurea, "Scarborough Lily."

An evergreen bulb from Cape of Good Hope producing splendid spikes of scarlet blossoms (not purple.) Does finely as a pot plant (in transplanting the roots should not be disturbed) blooming and increasing. The bulbs succeed best and bloom more profusely if left undisturbed. Same culture as for Amaryllis.

Watsonia, "Bugle Lily."

A genus from Cape of Good Hope. Bulbs closely allied to Gladiolus introduced some thirty years ago. Never very popular in eastern States, but of late has become most popular in California. Especially a variety which has a pure white flower, grows five to eight feet high, blooming in early spring. Should be handled same as Gladiolus except is not possible to hold bulbs so long, should be planted in fall or bulbs will be apt to perish. A beautiful and rare plant.

News of Country Life in the Golden West

Southern California Northern California

AGRICULTURE.

Grain threshers near Oxnard are putting out a large output.

One farmer in Moreno Valley has now harvested 12,000 acres of grain.

Quite a number at Hemet are taking the examinations for Forest Rangers.

Onion growers are strictly in it with the prices now prevailing in all markets.

Bad brush fire back of Elsinore last week covered an area of 2 1-2 by 15 miles.

A trainload of fifteen cars of cattle arrived at Brawley last week from Phoenix.

Hunters are rapidly putting down their little \$1.00 and securing permits for hunting.

Riverside county bee men report the honey crop far in excess of that of last year.

Riverside reports the grain crop of the county to be about 65 per cent of the average.

Large number of bee owners suffered complete loss of their stands by brush fire near Elsinore.

Brush fires back of Arlington Heights caused the destruction of a large amount of hay last week.

Street Warden Reed, of Riverside, is making an effort to abolish bill boards from the hillsides of that section.

One melon grower near Brawley reports the picking of \$700 worth of melons from a six-acre patch in two days.

Bee-keeping is growing more popular each year, and yet there are many in this country who could but do not keep bees.

A through express car from Imperial valley to Los Angeles is proving a boon to shippers of fruit, vegetables and cream.

The Colorado River is slowly, but surely going back to its regular level and no thought whatever remains of dangerous high water this year.

Johnson and Musser, seed men of Los Angeles, are buying seed in the neighborhood of Brawley, and will encourage its production in that section.

Fertilizer is being shipped into Hemet to be used on the winter crop of potatoes. Very satisfactory results were obtained by those ranchers who used it on the spring crop.

Consulting Engineer Grunsky has finished his examination of the Colorado River levees and the Imperial valley and it is understood that he will advise the Government aid in protecting that rich section.

A large planting of pine trees on the properties of the Brookings Lumber Co., in the San Bernardino mountains is said to be doing finely, and gives promise of a new crop of lumber some day not so far removed as one may imagine.

The Imperial Valley Press published El Centro complains bitterly that the Cultivator announced that Imperial received \$150,000 to \$200,000 for the cantaloupe crop which credit should have been given to the entire Imperial Valley. This we regret, but feel that the sensitiveness is uncalled for, for the only intention was to attract attention of the State to the immensely rich section so short a time ago a desert.

HORTICULTURE.

The hot weather pleases the lemon growers.

Redlands reports orange shipping practically finished.

Water in Lake Hemet is now reported to be 121 feet deep.

Land owners in Ventura county are putting up signs warning hunters to keep off.

The apricot crop was all marketed this season far in advance of any former season.

Oranges at Riverside now promise a normal yield and lemons are setting a heavy crop.

Brawley claims the honor of shipping the first full car of grapes from the Imperial valley.

Returns from oranges of the late picking all over Southern California promises to be great.

More than twice as many cars of cantaloupes have been iced and shipped at El Centro as last year same date.

Seventy thousand trees were set out in the San Bernardino forest reserve this last season and are claimed to be doing well.

Riverside Press is authority for the statement that one land owner in Moreno valley will plant a 10,000 acre orange grove.

The Escondido Mutual Water Co. proposes to foreclose liens on certain water users unless same are paid before August 1st.

Redlands Citrograph is urging prompt preparation of exhibits for the National Irrigation Congress to be held in Sacramento.

The Horticultural Commissioners of Orange county are making a campaign against the promiscuous growing of weeds on vacant lands and roadsides.

A meeting of the Tri-counties Reforestation Committee was held at Santa Ana July 1st, at which steps were taken to promote interest in forestry to a greater degree.

The various sections of the Imperial valley, at least the newspapers, are having a great scrap as to their merits. There is enough good in each to be placed without this everlasting pulling down.

A genuine hot wave all through Southern California of the week of the 4th made things exceedingly interesting for the residents of the desert valleys. One hundred and twenty degrees in the shade was reported from some sections.

The supply of water being developed in the Antelope valley is proving to be greater than at first anticipated, and will add greatly to the wealth of that section. Water has been found in some sections never before thought of as having water supply.

Van Winkle Brothers took off of 898 trees on eleven and one half acres a little over one hundred tons of apricots which sold at \$60 a ton. The expense of picking and hauling amounted to \$400. This nets them \$486.50 a acre. Mr. Van Winkle purchased this orchard a year ago for less than \$200 an acre. Will Martin took 20 1-2 tons of apricots off of 3 acres and sold them at \$60 a ton. About 700 tons of Hemet apricots have been canned. Not many were dried this year on account of the high prices.

AGRICULTURE.

The melon shipping season will soon open in the neighborhood of Fresno.

The Colbrook Creamery at Loleta, Humboldt county, is in financial straits.

Potato growing, which is proving profitable near Turlock, is attracting more attention.

A telephone line is being extended to the government reserve in Shasta and Trinity counties.

San Joaquin Valley Farmer published at Fresno ceases its publications for a few months.

Farmers near Redding are at law with the Northern Light and Power Co., over water rights.

The annual session of the Northern California Bee Association was held in Sacramento last week.

Hop prospects are anything but satisfactory, another slight drop in prices occurring last week.

Sutter county is shipping cattle to Portland, Oregon. One bunch of three carloads going in one day last week.

A hop buyer at Ukiah, is now offering only 5 1-2 cents and some claim they may drop to 4 or 4 1-2 cents.

The New Era Creamery near Newman will soon move into their new building at Gustine, Merced county.

Roseville not only produces roses, but now makes a show of some of the finest spuds grown in the State.

A row is going on the part of residents in the neighborhood of Tulare Lake owing to its proposed draining.

Clovis is scrapping over irrigating ditch right-of-way where neighbors have carried their case into the courts.

A new colonization scheme is about to be promoted near Firebaugh where 10,000 acres will be opened to settlement.

The story of growing the potato and tomato on the same vine is being reheated in some of our northern exchanges.

The Chico Record claims big development along dairy lines of that section. One creamery turned out 2600 pounds a day.

The barley field at the State Farm near Davis is yielding an average of thirty bushels per acre, which is considered an auspicious start for that farm.

Lake Tahoe shows the highest water in several years and some residents near it are threatening to blow out the dam constructed to retain the waters.

Break in the Kern River levee which did over \$1,000,000 damage to grain and other crops also put the Sunset Railway out of commission for several weeks.

State Forestry Department is investigating a field fire which occurred near Marysville caused by carelessness of section hands. About \$10,000 damage being caused.

Ex-Governor Pardee addressed an enthusiastic convention of farmers at Salinas last week on the problem of securing government aid on a great irrigation project for that valley.

Glanders amongst the horses of the Western Pacific Construction Camp is causing the Sutter county horse owners great uneasiness. Ten horses were recently killed badly affected with the disease.

HORTICULTURE.

Yuba City cannery is to begin operations about July 15th.

Large fruit farm of 250 acres is reported sold at Anderson.

Several field fires have occurred near Modesto in Stanislaus county.

Forty dollars per ton for prunes on the tree is reported at Vallejo.

A dam has just been completed across the Russian river near Healdsburg.

The first full carload of apples from Sutter county left Yuba City last week.

Turlock is claiming some of the finest and juiciest cantaloupes in the State.

Four hundred and nineteen cars is the output of oranges in the neighborhood of Exeter.

Work is being taken up on the formation of a new reclamation district in Sutter county.

A number of Southern Californians visited the Lincove orchard section near Exeter last week.

Corning claims a fine fruit crop this year, and that for all Tehama county this will be a banner year.

Anderson pear growers are urged to wake up and unite to secure the eradication of pear blight.

"Under the heel of the Japs" is the way the Porterville enterprise sizes up the fruit growers situation.

Luther Burbank has produced five entirely new varieties of thornless cacti at his grounds near Sebastopol.

The trouble over the Fair grounds at Fresno has been settled and the Agricultural Fair will be held this fall.

Another big reclamation district is to be formed on the lands comprised in a part of the Laguna district south of Fresno.

The Yolo Democrat is in hopes the State may be prevailed upon to assist in the matter of improving the Sacramento River.

Some property owners at Marysville are proving obstreperous in allowing the eradication of the white fly from their places.

An advertiser in the Corning New Era claims that "sulphur sown broadcast under prune trees will destroy the red spider."

The Guggenheim Co., of Fresno, has secured the large Seropian packing house which they will use in the coming raisin packing.

One packing company at Yuba City estimates that it will put out about 30,000 cases of green grapes and peaches this season.

There will be a civil service examination of candidates desiring positions of ranger in the Forest Service at Hot Springs July 23d and 24th.

The Board of Supervisors of Tulare county are being urged by citrus growers to take every possible step to prevent importation of the white fly.

Lodi fruit growers have organized a Lodi Fruit Growers' Association for the purpose of securing better returns for their tokays and other green fruits.

San Jose Chamber of Commerce is sending out advertising matter largely composed of descriptions and illustrations of Santa Clara valley's great seed farms.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Special Sale of White Leghorns

Mitchell Stock 200 Yearling Hens at \$18 per dozen
100 2-Year-Old Hens at \$15 per dozen

Also some choice White Leghorn and Black Minorca Cockerels. These birds are all in good condition. Hens are from my breeding yards and must be sold to make room for my young stock. Write or call. Satisfaction guaranteed.

S. E. GREGG, 126 So. Adams St., Riverside, Cal.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

THE POULTRY HOUSE.

THE subject of houses next to location, is important. In our climate of the Pacific Coast it is not necessary to put so much money in houses as in the northern and eastern States, for here all that one needs is a house that will shed water and afford protection from the wind. Although we have had houses face the north with no ill effect we prefer any of the other directions, as it is necessary to have sunshine sometime during the day to keep them fresh.

It is our purpose to write only of a practical house, and not go into detail for a house, made simply to satisfy a fad or fancy of some one without considering the practical or financial side of it.

Open Front House.

We believe in the open front house for the climate of the Pacific Coast. Its advantages have been proven time and again. The single span (or shed) roof is the easiest to build. It gives the highest vertical front exposed to the sun's rays, which are reflected, drying the ground. It throws all the rain water to the rear, lessens the length of each trough and keeps the ground in front of house dry. If you live near the coast where fogs are frequent and where the trade winds are strong you can use the burlap front, or curtain. We recently had the pleasure of visiting a poultry ranch that had a half open front. We liked the idea, but believe the whole front open would have been just as good and less expensive to build.

A Hint For a Plan.

A good plan and size for a house, if you want a scratching shed in construction, is, 10 feet wide and 14 feet long, this by putting a partition through the center will give you a roosting room 7 feet by 10 feet and a scratch shed same size. Front of building should be 7½ feet high under eaves and 5½ feet under eaves at back. This gives you a better chance to clean without stooping or getting your head bumped when working.

Material.

Plain siding is good enough, but should be sufficiently tight to prevent draughts in house. The roof can be made of some kind of roofing paper.

We know of good and inexpensive houses that are made entirely of roofing paper. The house or frame is made first, then poultry netting is tacked over this and covered with roofing paper, tacked at corners. The wire simply to give it strength.

The Burlap Front.

A frame should be made size of end of house, hinged at top. This should be covered with burlap and should have hooks to fasten up to roof out of way when not in use. This curtain can be let down on cold and foggy nights. You will be surprised to find how much dampness it will keep out of your house; it seems to absorb all fog and keeps the house dry, and at the same time give you the fresh air desired.

The Scratch Shed.

The scratching shed for best re-

sults should have a board floor; this will keep the litter from becoming damp and will not have to be changed so often. What you will save in labor when cleaning and the difference in cost of straw for litter, will soon pay for floor. It can be built of any waste lumber and does not necessarily have to be tight.

Roosts, Nests, Etc.

In the roosting end of house arrange your dropping boards. They should be about 18 inches from the floor. Above these you can arrange your roosts which should be about four inches higher than the board and two and one-half to three inches broad. A good plan for roosts is to take two pieces of two by four scantling ten inches long; to these tack a piece of beaded ceiling, set this on dropping boards, don't nail as you will want to remove when cleaning. Under dropping boards you can arrange your nests to suit your convenience.

MODERN POULTRY CULTURE.

Our experiment stations and best students of poultry culture, working along lines of theory and also actual practical demonstration in the fowl yard, have presented many advanced ideas for our consideration and acceptance or rejection. Their analysis of foods gives us a wide range of selection in feeding materials and correct idea upon the balancing of rations from the materials within easy reach. Yet how many poultrymen who may take the time to read this article feel themselves competent to select, with confidence, the material best suited to the development of body growth, egg production or for fattening, as well as those most conducive to health and procreative vigor?

Get Advanced Ideas.

It means success or failure; a profitable business or unnecessary expense and loss. Every producer of eggs or meat, every breeder of fancy fowls for the exhibition room or breeding purposes should avail themselves of the advanced ideas obtainable at government expense. The value of milk, as a food for fowls according to government investigation, is way and beyond that which we have previously attributed to it. Oats for laying hens has never to my knowledge been considered a popular food, yet our professional brethren make the statement that for the ruling prices in our Eastern markets it is one of our most valuable and inexpensive foods. [Its use has often been urged by the Cultivator, especially for growing chicks.—Ed.] It is not my purpose to repeat or quote from the bulletins obtainable from the several stations for the asking, but to call the attention of the poultrymen to the value of the information. Eastern fanciers and breeders are more progressive in this respect than we of the West, for the obvious reason that they are more in touch with the workings of our scientific investigations and also closer to the greater activity in poultry culture, both fancy and commercial, of the United States.

It is my opinion that loose methods and inferior quarters and conditions not conducive to the best results, as well as an absence of thorough knowledge in the actual every day work in the fowl yard, is largely responsible for the very inferior qual-

Silver's Clover Cutter

For Poultry

This machine will cut clover, alfalfa, straw, vegetable tops and similar material, green or dry, into 1/2 inch lengths, which makes it especially adapted to cutting feed for poultry. It is all iron and steel, consequently very durable. Length over all, 24 inches. Size of feed box, 18 inches long by 10 inches wide at rear end, by 8 inches at throat. Feed rollers are full width of cutting surface. Has 8-inch, 4-bladed, solid center, spirel knife, with adjustable cutter-bar, like a lawn mower. Capacity is a bushel of cut clover in 10 minutes or less. It is intended to be mounted on a bench or box to make it right height for operator.

ity of poultry produced and the limited demand along fancy lines for thoroughly and scientifically-bred fowls.

California Has Them.

Why will Mr. A send East for a male, a pair, trio or pen of fowls at prices way beyond what the same quality of birds can be purchased for right here in California and I will suggest the reason. Pacific Coast breeders have not asserted themselves; have not supported and made available the several means of publicity at their command. A fancy fowl of a stated quality ought to command as much in California as in the East. Many of you have paid Eastern breeders, even English breeders, several times what can command there for their best offspring; this condition is not a healthy one. Ways and means, every one available, to correct this condition and create an active demand for our California product at profitable prices. Organization, publicity, even in Eastern journals, will prove an important aid to reaching our object. There is an urgent need of more poultry exhibitions. More enthusiasm in our poultry press. Let the poultry industry assert itself and bring prominently before the Pacific Coast its importance. The advance in price of other meats controlled by trusts and monopolies should surely prove a source of encouragement to the producer of poultry and eggs.

Looking conditions squarely in the face, was there ever a time in the history of poultry culture when a brighter future was assured and a more active demand anticipated. All that is needed is the employment of correct methods of production, advanced and progressive business relations with the consumer, placing at his disposal an attractive and well finished product. Where do the thousands and thousands of tons of half-fed poultry produced by the numerous farms of the Middle West, by people ignorant of the possibilities of poultry culture, go to? A large per cent of it goes to such firms as Armour & Co., Swift & Co. What do they do with them? They are sorted; the most desirable are placed in pens and intelligently fed on scientifically-balanced foods for the production of a tender, fine flavored finished fowl. This class of poultry finds its way to the tables of aristocracy of two continents. If these large firms can afford to pay the producer also the cost of fattening and transportation even to England and make a profit, what should you be able to command for a high class product for which the public is not only ready but willing to pay profitable prices to secure? A high class product is always in demand.

It's the poor quality article that goes begging for a purchaser. These and many other conditions largely due to improper methods of production, marketing, etc., as well as not enough thought and brains put into the business are the cause of the present conditions and prices to the producer of poultry and eggs on the coast.—J. W. Whitney, Long Beach.

A teaspoonful of sulphur in a quart of soft food given the hens on dry days, is one of the best medicines where disease appears, and it is excellent when burned in poultry houses, as the fumes of burning sulphur will not only destroy the lice, but also the germs of many diseases. Do not add it to the food in damp weather. As it is cheap, a supply should be kept constantly on hand.

Molting Time

is the time to provide for eggs when they will be scarce and high. Don't let your hens molt for months. Don't let them get completely run down and all out of condition. This they will certainly do unless you use care and intelligence in feeding them through this trying season.

West Coast Egg Food

is a highly nitrogenous Poultry Food, rich in protein, composed of the finest grains, seeds, roots, salt, iron, charcoal, condiments, shells, oil cake, bone, meat and dried blood to keep the poultry in good health, build up a strong and vigorous system, make the hen molt early and convert the surplus aliment into eggs. It is a full, scientifically balanced ration containing no filler but every ounce is pure food. Many so-called "Poultry Foods" and "Egg Makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. But it is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it does not make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that a hen has no use for the shell until she has made the egg.

West Coast Egg Food

is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve the purpose of assisting the hen in her molting and then in producing eggs, and at the same time to build up her system and keep her in the best of health. The hens like it, they eat it, there is no waste, hence it is the cheapest Egg Food on the market.

West Coast Egg Food

can be fed either as a mash or as dry feed, though we recommend the latter because it is more natural and, we think, the better way. Don't ask Biddy to fill the egg basket without giving her good care and providing her with proper material for the purpose. Feed her West Coast Egg Food. For sale by many dealers. If yours doesn't keep it, or will not get it for you, send direct to us.

Manufactured by the

West Coast Stock Food Co.

Coulson's No. 3

Condition Powder For Poultry

If you are not already using Coulson's No. 3 Condition Powder, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season.

If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

We Claim Coulson's No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in.

We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are now beginning to molt heavily, their combs are as bright and red as at the beginning of the season.

You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably.

Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want it.

Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following Prices:

10-lb. Package, \$1.50; 25-lb. Package, \$3.25; 50-lb. Package, \$6.00; 100-lb. Package, \$11.00

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW and insure yourself lots of eggs when prices are high.

Bees and Their Care

COLONIZING THE NEW SWARM.

"JOHN-NEE!" called a woman with a strident voice to her son across the yard, "you go up into the loft and git me one of them bee hives—git it right away! These bees act as if they were going to swarm. They are just loafing around and doing nothing and the top story is jam full of the pesky things."

She was in the bee-yard with her smoker, whither she had gone with me, says a writer in Farm, Stock and Home, and had just peeked under the cover of one of the hives, when her voice rang out with a suddenness that made me jump. As the air continued to vibrate with the metallic echoes of her voice, I wondered how long her bees would stand it. It seemed to me that the very covers of the hives fairly rattled with the energy of that voice. My own bees would not have stood it a minute, and I backed away in fear to the partial shelter of a lilac bush. The wisdom of my action was soon apparent, for as she opened her mouth to call some further directions to her son, a bee—of whom I fully approved—hit her a dab right in the mouth. But she did not mind it much and was soon very busy "driving a swarm."

I had never met the woman before, but had been passing the place which was new to me. As our horses were tired and in need of refreshment we also rested. I had seen a few hives of bees in the yard, so had asked her permission to go out where they were and she went also.

I am a great lover of yellow bees, and whenever I had a chance I was looking out for a strain prettier and yellower than my own, but I never found them. The pure yellow is not an especial mark of pure breeding among the Italian bees. There is a leather colored Italian much advertised, and three or four ringed Italians that may be just as pure. The mark of pure breeding is that each bee shall be like all the others in the hive. The "tested queen" that one sees offered for sale is one whose brood hatches out all alike. When a pure bred queen meets a hybrid or a black drone, of course her brood cannot be pure-bred, but will have all sorts of markings, generally shown in varying numbers of rings around the body. The queen never meets the drone but once, so if she be purely matched she is mated for her lifetime. A queen being a fully developed bee often lives 4 or 5 years and does good work. This is the reason that we are willing to pay a dollar and more for a tested queen.

My hobby has been the yellow bee. I not only wanted her covered thickly with yellow rings from her belt to her stinger, but I wanted all the intermediate space covered with yellow down, so my bees in flight looked like rays of sunshine. This taste in bees kept me on the lookout for yellow bees, and took me into all the bee yards I came across, besides hunting over all the advertisements of queens. Clean and Bright.

I was quite curious to see what my new friend of the metallic voice was going to do with the loafing bees. I soon found out. The hive brought her was a very dusty affair, but she brushed it thoroughly, then washed it inside with cold water in which salt had been dissolved. She placed this hive beside the "loafers." Then going into the house she brought out

an armful of frames to fit the hive. Some of them had bright, clean combs in them, and some had mere strips of foundation.

These she placed in the cleansed hive and covered it. Then she blew a few whiffs of smoke into the entrance of the hive of loafers—not much smoke, just enough to alarm the guards and let them know that their master was about. She then pried up the super or top-story without taking off the cover, and set it on a blank super at a little distance. This left exposed a hive body just boiling over with bees and honey. The two hive bodies being just alike, she put the clean one right on this full hive, and as I saw the double hive stand there I wondered "what next?" She picked up a little stick about the size of a chair rung and began to tap on the lower hive. She went all around it, tapping on every side. She kept this up for some five minutes, then took a peep under the cover. I saw to my astonishment that the tapping on the lower hive had driven the bees up into the upper hive. She shut down the cover hastily, gave a few more little taps "to keep the bees from getting down stairs again" she said, and quickly lifted the top story back into its bottom board. I could see a lot of bees had been left in the full hive, but not one-tenth of the whole number. She covered it up and carried it to a distant part of the yard. "I don't wish the bees to find their old home," she explained. "I want to get all the bees with the new swarm I have just made. The ones that staid by the combs are the very youngest bees in the hive and are enough to keep the brood warm this weather," for it was July.

Then she moved the new swarm onto the old stand, got the super full of bees that she had first removed, and then to all intents the hive looked just as it did when we first entered the bee yard. "Does that always work?" I asked. "Do they never swarm out and go off?" "Never," said she, "if you catch them just at the right time. Sometimes when I drive them too soon they don't behave well, but it is better than to lose as many swarms as I do some years."

Lively Enough.

My new friend then took her smoker, a turkey wing and a strong, thick-bladed knife, and we went over to the hive that she had placed in another and distant part of the yard. No bees were flying about the hive and none were in sight at the entrance. "It looks dead," I said, thinking of the populous colony it had so lately been. "They will be lively enough in a week," answered she. "Just wait until that brood has time to hatch and there will be another swarm or two coming out. But I'll prevent that," lifting off the cover with a bang. She smoked the bees a little more and then lifted out the frames one at a time and carefully looked them all over for queen cells. And she found them, too; more than a dozen sealed queen cells that looked like peanuts, both in color, shape and corrugations. All of these were cut out and thrown away excepting one fine one. "There," said she, "now you will stay where you can do the most good." She had used the turkey wing to brush off the bees when they were clustered so thickly as to hide the queen cells.

"How do you know the old queen was with the new swarm?" I asked

The Angle of a Hoe

Grasp a Keen Kutter Hoe as you would in the field—better yet, put one to actual service, and see how well it fits its job. The angle of the blade is just right. If you strike at a weed, you are sure to cut it—if you "hill" a plant, it carries a full load of earth each stroke and does it all in the easiest position you can assume.

KEEN KUTTER

hand tools for the farm—Forks, Hoes, Rakes, Scythes, etc., are fitted by model and temper for great service and long wear.

Keen Kutter bench tools are the best to be had. The list includes Planes, Saws, Axes, Hatchets, Hammers, Adzes, Augers, Draw-knives, Chisels, Gouges, Bits, Braces, Gimlets, Squares, Bevels, Files, etc., besides every possible tool and cutlery for the household. Look for the trade-mark—it guarantees quality. If not with your dealer, write us.

Too Much Water

OW many times have you seen your fields flooded with moisture after a heavy rain, to the ruination of your crops?

The loss of crops by flooding is a thing unknown on irrigated lands, because where irrigation is practiced drainage is perfect, and all the excess water which falls is promptly carried off where it will do no harm. The irrigation ditches act as drainage ditches in case of overflow.

On the great irrigated tract of the Canadian Pacific Railway in Sunny Southern Alberta is to be found some of the richest land on the American continent, where almost any kind of grain and root crops can be raised.

Alfalfa thrives, and with the natural conditions and constant water supply, which makes Southern Alberta a perfect live stock raising country, the farmer is assured of reaping large and certain profits from the sale of his cattle, hogs and sheep.

The native grasses that grow on the plains of Alberta furnish fine feed during the summer months, and the alfalfa can be depended upon to bring the live stock through the winter in fine condition.

Sugar beet raising is one of the most profitable industries in Southern Alberta, under irrigation. Larger crops of beets can be raised here than in most of the states, and a better market is right at the door of the farmer. Beets bring \$5 per ton. The price is guaranteed, and the demand constant, so that the farmer takes no chances of having a drug on his hands when his crop is harvested.

Everyone who studies farming conditions knows that Southern Alberta is the greatest wheat raising country on earth, and oats and other cereal crops thrive and produce enormous crops.

Poultry of all kinds does well in Southern Alberta, and a good market is always ready for the lucky man who has chickens, turkeys, ducks, geese or other fowls to offer.

Quit trying to make high-priced land in the Central or Eastern States pay, and come out to Alberta where you can get five to ten acres for every one you now own, which will produce from three to five times as much under irrigation as your acres produce.

Farming conditions are perfect in Alberta, good markets prevail, school facilities are of the best, and neighbors are Americans. Then why not come to a place where money-making is easy, and where you can be out of debt, independent of the world?

Write and let us tell you how to see Alberta at very small cost. Let us tell you how to get a farm that will make you and your children rich.

"O, that's easy," said she. "The queen is always the first one to scud out of danger and a good body guard always go with her to protect her as far as possible. If I had left the new hive there a minute she would have been down with her brood again. That was why I hurried it off the brood frames, before she got back."

We walked back before I left and looked over the newly made colony. for they really seemed to have settled down to housekeeping. Two hours later when I came away, both honey and pollen were coming into that hive at a lively rate.

This woman seemed to understand her business and made money out of her dozen or more colonies of bees, but she was the only loud-voiced, abrupt, noisy bee-keeper I ever saw. —Farm, Stock and Home.

TREATMENT FOR GOOSEBERRY MILDEW.

Continued from First Page

In other plantations where spraying was carefully done the greater part of the crop was saved, the foliage remained in good condition and the fruit buds were set for a succeeding crop. The extent to which mildew can be prevented, by spraying, depends upon the weather conditions and location. In a wet season it flourishes abundantly and is indifferent to control. The disease, as already stated, usually obtains a foothold on the lower parts of the bushes where the shade is dense. These parts are very difficult to reach thoroughly with spray solutions, and in a year when the other conditions favor the spread of the fungus, are liable to harbor more or less of the disease unless the greatest care and thoroughness are used in spraying. In a dry season mildew can be almost prevented by thorough use of fungicides. On uneven ground the higher parts of a plantation seem to be less subject to the disease than the lower parts. The best location seems to be one well elevated, with a gradual slope affording good air drainage."

Then follows record of a series of experiments in which the fungicides and results are detailed.

Fungicides Used.

Bordeaux mixture is claimed to be of little value in handling this trouble. The table of results from spraying seven times with that mixture still shows more than fifty per cent of the disease shown in the "check rows." Formalin was also used and proved only fairly successful, while the best results were had with the simple spray of sulphide of potassium dissolved in water at the rate of one ounce to two gallons of water. The summary of the three season's work is given in these words:

"For three seasons, Bordeaux mixture, lysol and formalin have been compared with potassium sulphide, the latter giving the best results in all three series."

"The Bordeaux mixture proved comparatively valueless, as in but one series of tests did treated bushes show less mildew than check bushes; formalin in the strongest solution, one ounce to one gallon of water, gave fair results, but weaker solutions ranked with the Bordeaux mixture; lysol gave promising results coming next to the potassium sulphide in reduction of mildew injury."

With one exception, Bordeaux mixture, very early spraying gave better results than medium early or late treatments."

"Winter treatment was tested during one season, but did not give sufficiently favorable results to justify recommendation."

Recommendation.

"In a former bulletin potassium sulphide, one ounce to two or three gallons water, was recommended as the best remedy. The results of three years show that it is still the best fungicide the Station has thoroughly tested. Spraying should be begun very early just as the buds are breaking and continued at intervals of about ten days.

Further testing will be necessary to determine the relative merits of soda-Bordeaux mixture and the copper carbonate solutions in comparison with potassium sulphide solutions for checking gooseberry mildew."

Enjoy a cool, refreshing drink anywhere, any time

APPELL'S SOUTH AFRICAN WATER BAG

(PATENT APPLIED FOR)

Keeps water cool 48 hours or longer; in sun or shade; no ice; light and convenient to carry. It is a great boon to timbermen, stockmen, rangers, farmers, travelers, prospectors, surveyors, sportsmen, miners, threshing crews, millmen, railroad men teamsters, boatmen and everyone exposed to dry, warm weather, away from good water supply. Can be carried on the shoulder, hung on a tree, saddle, or vehicle, or left on the ground—anywhere so it is exposed to air. Satisfaction guaranteed or money back.

THE CALF PATH.

One day through the primeval wood
A calf walked home, as good calves should;

But made a trail all bent askew,
A crooked trail, as all calves do.

Since then two hundred years have fled,
And, I infer, the calf is dead.

But still he left behind his trail,
And thereby hangs my moral tale.

The trail was taken up next day
By a lone dog that passed that way;

And then a wise-wether sheep
Pursued the trail o'er vale and steep,

And drew the flock behind him, too,
As good bell-wethers always do.

And from that day, o'er hill and glade,
Through those old woods a path was made;

And many men wound in and out,
And dodged and turned and bent about,

And uttered words of righteous wrath,
Because 'twas such a crooked path;

But still they followed—do not laugh—
The first migrations of that calf,

And through that winding wood-way stalked
Because he wobbled when he walked.

This forest path became a lane,
And bent and turned and turned again;

This crooked lane became a road,
Where many a poor horse with his load,

Toiled on beneath the burning sun,
And traveled some three miles in one.

And thus a century and a half
They trod the footsteps of that calf.

The years passed on in swift feet;
The road became a village street.

And this, before men became aware,
A city's crowded thoroughfare;

And soon the central street was this
Of a renowned metropolis,

And men ten centuries and a half
Trod in the footsteps of that calf.

Each day a hundred thousand rout
Followed the zizzag calf about,

And o'er his crooked journey went
The traffic of a continent.

A hundred thousand men were led
By one calf near three centuries dead.

They followed still his crooked way,
And lost one hundred years a day;

For thus such reverence is lent
To well established precedent.

A moral lesson this might teach,
Were I ordained and called to preach.

For men are prone to go it blind
Along the calf-paths of the mind,

And work away from sun to sun
To do what other men have done.

They follow in the beaten track,
And out and in, and forth and back,

And still their devious course pursue,
To keep the path that others do.

But how the wise old wood-gods laugh,
Who first saw the primeval calf!

Ah! many things this tale might teach—

But I am not ordained to preach.

THE CONVERSION OF MARJORIE.

MARJORIE Milburn stood by the window with a vexed look on her pretty face, an open letter in her hand. "Oh, bother!! how provoking! I suppose I'll have to go though."

"Have to go where, dear?" said her mother, who had entered the room in time to hear the last words.

"To Bellview, mother; but here is the letter; it explains itself." Mrs. Milburn took the letter, which was as follows:

"My Dear Cousin: As the doctors have ordered your father to the seashore and Aunt Jennie must go, too, why can't you come down and spend your vacation with me? I would so love to have you; it has been so long since I saw you I feel as though we were almost strangers and would very much like to get acquainted. How is Uncle John. I hope much better. Well, mamma and I are going to drive out to town this morning so I must be going. Now please come, we shall be so disappointed if you do not.

Your loving cousin,
"Ethel Milburn,
Lake Side Farm."

June,—19—.

"Well dear, perhaps it would be a change," began Mrs. Milburn as she finished reading the letter.

"Oh well! I suppose I must go," said Marjorie, "but I do so hate the country! You remember don't you mother, when I went out to the country with Jessie Vane to visit her Aunt? what an awful week we spent! The mosquitos and flies and—Oh well, what's the use, I'll have to go I suppose."

"Your aunt and uncle would be hurt perhaps and your father I am sure would not wish to offend them. Your uncle wrote your father not long since that he was making some money, so perhaps you will be quite comfortable," said her mother.

"O, I dare say I shall get along somehow," said Marjorie as she left the room. Taking a photo upstairs to her room to study it presumably to see if it gave any indications as to what sort of place her uncle's farm was. It was her cousin's picture. "A nice face as seen in a photo" said Marjorie to herself, "but no doubt she has freckles and sunburnt hair, which don't show here. Yes, and red, rough hands (glancing at her own white fingers) like Jessie's cousins. Oh well, I'll try for her father is papa's own brother, but if I just can't stand it I'll come back and board or—something till papa and mamma come home."

The next week saw Marjorie on her way to Lake Side. After a two days' ride through a fine farming section, a very tired and I must say a rather homesick girl alighted at the little station of Bellview and stood alone on the platform rather perplexed to know what to do as there was no one there but an old farmer in a wagon, who she decided was not Uncle Will. "Oh yes, at last here comes someone, but no, that was certainly no farm turnout," Marjorie thought, as a nobby gig and fine spirited horse driven by a stylishly dressed young lady dashed up to the platform. "How do you do?" said a pleasant voice, "you must be Miss Marjorie Milburn," and Marjorie found herself being warmly kissed by the young lady who stood with the reins in her hand smiling down at her, who it must be confessed was looking rather surprised. They were

soon on their way past well cultivated fields and comfortable farmsteads and after a delightful drive of three miles turned into the gates of a fine, prosperous looking farm, with large barns sleek cattle and fine shrubbery surrounding the house. If not so stylish and showy as some city homes, it was large and by no means unpretentious. A farm hand came forward to take the horse away, and Marjorie soon found herself in a comfortable sitting room after being warmly welcomed by Aunt Hanna, who explained that Uncle Will had gone to a sale of pure-bred Short-horns but would be back by supper time. She was taken then to a large, airy room upstairs to rest awhile before supper, which she found not so elegantly furnished as her own at home, but delightfully cool and dainty and filled with the scent of lilacs and roses. Huge bunches of them decorated the dresser and stands, while the spotlessly clean muslin curtains were draped back, affording a charming view of the blue lake in the distance beyond green and velvety pastures and meadows.

Marjorie was surprised; this was a revelation to her. For, having gained her knowledge of the country by a ride past some out-of-repair and slovenly looking farms, she never dreamed what a nice place a well managed and up-to-date place really is.

She was up bright and early the next morning to see the garden and flowers and to help Ethel feed the chicks, while Aunt Hanna and Emily, the hired girl, prepared breakfast. Marjorie could not help comparing this with breakfast at home where her father before he was taken ill would rise and after breakfasting alone, was off to office many a morning before she and her mother were stirring. Here it was different. Every one was up bright and early and to their work while the dew was still on the grass and every leaf and twig sparkled like diamonds in the morning sun. There was an air of cheerful festivity about the whole place which was very pleasing.

Marjorie was heartily ashamed of her unkind thoughts about farms and farm people as she followed Aunt Hanna and Ethel about and tried to assist them in their work. "Do you milk many cows, Aunt Hanna?" said Marjorie, who had not seen any milk brought in nor had a glimpse of a milk pan though she had passed through the kitchen many times that morning.

"Only fifteen," said Aunt Hanna, who then remarked that the men had finished milking and separating before breakfast. She was taken to the separator room and was surprised to learn that the warm milk was run through this machine and all the cream taken from it while the sweet skimmed milk was carried at once to the pigs and calves.

"And that is all you have to do, no crocks or pans to wash, just put the can of cream down cellar, wash the pails?" said Marjorie in surprise who thought the farmers' wives spent the forenoon of every day carrying sour skimmed milk up cellar steps and washing innumerable crocks and pans. (For had not Jessie's aunt done so?)

"You girls may take the cream to market this morning before the sun is hot," said her aunt, or if you do not care to go father will take it, but Marjorie thought a three-mile jaunt behind the spirited black on

uch a morning would be delightful. The afternoon was spent by the lake a half mile distant where Uncle Will and the two girls fished the lazy hours away and "got acquainted" as Uncle Will expressed it. When they returned at four o'clock Uncle Will went to work in the garden while the girls hunted throughout the great barn for eggs. "The chicks must be fed and strawberries stemmed for supper," said Ethel. Marjorie was delighted with it already and when he wrote her mother that evening he said among other things: "I am having such a good time. I never thought life in the country was so nice."

So the days glided by: there was boating, fishing, horseback riding to say nothing of picnics and little excursions to the woods in which Aunt Hannah often joined. Marjorie's

cheeks grew plump and rosy and her eyes bright while the exercise in the open air each day gave her an excellent appetite.

"I never was so hungry in my life," she said to her mother when she returned home, "and such fruit and vegetables, cream and butter!" On rainy days when we were obliged to stay in doors we read or sewed, or there was Ethel's piano and violin always at our disposal and many happy hours were spent in the music room. So the weeks flew by and at last Marjorie received a letter saying her father was much better and would be able to return home immediately. With much regret Marjorie brought her visit to a close, not, however, without promising her uncle's family that she would be sure to spend her vacation with them again next summer.—Farmers' Tribune.

The Personal Neatness Club

RECENTLY Cultivator readers were favored with a few notes on "kinks" for girls in ironing ribbons, washing gloves, etc., by a subscriber who lives in Kentucky. We suggested our California girls take up the same matter and mail us items on little nice things to wear, how to keep room neat, where to keep gloves, handkerchiefs, "combs," now comes a couple of notes, one from the East again.

Miss M. H. tells of care of summer clothes. They are helpful hints. Read these, girls, then send in your hint to the Household Department, care of Cultivator, 115½ N. Broadway, Los Angeles.

Care of Summer Clothes.

How many women know how to preserve sweet and clean their summer dress, shoes, hose and so on. As soon as a waist is taken off, the sleeves should be turned wrong side out and allowed to air, and the dress shields should be sponged occasionally with alcohol and water and hung in the air to dry. The shields can be cleaned and freshened by washing them in warm suds to which a little ammonia has been added, and then after rinsing carefully, they should be pulled into perfect shape and pinned to a cloth drawn smoothly over a board.

Give added length of days to kid and other leather shoes, as well as keep them black and soft, by rubbing often with a little vasoline on a soft cloth, and when they become wet, they should be stuffed with soft paper to preserve the shape. The tops of high shoes should be turned back when taken off and the shoes placed on the window sill or some breezy place to get the sun and air, and nice hose should be filled with crumpled tissue paper and hung where the air can blow through them. White waists and dresses can be kept beautifully white and clean by washing them through a strong pearline suds and then rinsing through clean water, then they should be put through two blueing waters; the second a deeper shade than the first. By this means a better shade of blue is obtained as the color is more evenly distributed.

White veils may be nicely cleansed by soaking for half an hour in a solution of white soap, and the cleaning should be done by pressing and squeezing between the hands until they seem clean. Then rinse in clear water and again in water

slightly blueed with a little dissolved gum arabic added to give the right degree of stiffness.

Stocking Economy.

Instead of throwing aside a pair of nice stockings because the feet are worn out, buy a new pair of feet and sew them to the legs and you can get a good pair for ten cents.—M. H.

Flowers in the Room.

It may not be exactly along the line of the personal neatness you recently suggested in the Cultivator Household Department, but may I say just this: "That I wish more girls appreciated how much is added to their rooms and to the homes generally by the placing of a few simple flowers in the room. I recently saw a handful of "Tidy Tips"—Layia Elegans—which were so common over all the fields. No one had to cultivate them at great expense. Just went out and gathered a handful, dropped carelessly into a bowl where they took a most artistic shape which added beauty to the room for days. The Layias are gone, but in your own garden there are surely a few geraniums if nothing else. Make it a daily habit to place a simple bouquet where it will brighten the home.

Brother will like it (he may not say so,) mother will appreciate it and daddy won't grumble.—C. M.

HOMELY HINTS.

There are certain scents which insects will not tolerate, such as oil of cloves, oil of cinnamon, anise oil or oil of cedar. A few drops will scent a bureau drawer, and all bugs will keep away from it. Our informant declares that no matter how badly infested a bed may be, no bug will venture between sheets scented with any of these essential oils. Only a few drops are required, and a small vial should be in every traveler's kit.

Dates are good fruit, especially for persons inclined to be constipated. Here is a way to make nice date sandwiches: Cut thin slices of bread, butter lightly, spread with dates chopped fine, and form into sandwiches.

If nuts are eaten with salt they are more easily digested.

To prevent articles of silverware from tarnishing, warm them when well cleaned and paint them over with a thin solution of collodion in alcohol, using a wide, soft brush for the purpose. Articles so treated must be wiped only with dry cloths.

DENATURED ALCOHOL AND THE FARMER.

DENATURED alcohol is simply the commercial grade of pure alcohol made unfit for use as a beverage by having added to it wood alcohol, which is poisonous. This denaturing process must be under control of the United States government.

It is not likely that the individual farmer will operate and own his still. This would interfere too much with the regular farm work. The expense of inspecting these stills and denaturing this alcohol in small quantities would be enormous. There is no reason, however, why co-operative or county distilleries should not be set up in which the farmers would own stock, furnish the raw material and use the finished product on their farms or sell the surplus. In this manner, tax-free alcohol must necessarily be a benefit to the farmer.

The cost of denaturing alcohol will be that of labor and the cost of the denaturing agents, and should not exceed five cents per gallon.

The chief alcohol yielding materials produced in farm crops is starch and sugar. Used for this purpose they yield about 45 per cent of their weight in alcohol. This gives us a basis for estimating the amount of alcohol which different crops may yield. Thus the per centage of alcohol making material in different farm products, of which about 45 per cent can be converted into alcohol, is about as follows:

Rice, 80 per cent, rye, 72, wheat, 71, barley, 70, corn, 70, Kaffir corn, 70, buckwheat, 64, oats, 60, cow peas, 55, peas, 50, potatoes, 17, apples, 16, sugar beets, 15, corn stalks, (green) 12.

For example, suppose a farmer raise but 100 bushels of potatoes on an acre, these will weigh 6000 pounds. According to the above table seventeen per cent of this, or 1200 pounds, is starch. This starch will yield about forty-five per cent of its weight in alcohol, or 459 pounds which equals sixty-seven gallons. Thus the alcohol produced from one acre of potatoes of 100 bushels yield, selling for twenty-five cents per gallon, would amount to the sum of \$16.75.

Calculations made from any of the other farm crops, as to the amount of alcohol which may be produced, will look rather small from the farmer's standpoint.

Under these conditions, it would hardly be a paying proposition to raise the average crop, for the production of alcohol. However, there is always, in connection with the farm, some products which could be readily converted into alcohol, which would otherwise be totally lost. This alcohol would, in the majority of cases, furnish the heat, light and power necessary for that farm, and would at the same time, tend to keep down the price of gasoline and kerosene.

For lighting purposes, alcohol has been found to possess almost twice the efficiency of kerosene. It furnishes a brighter, cleaner and whiter light, without the disagreeable odor, and is safer than kerosene.

For power purposes, according to Lucke, "An engine designed for gasoline or kerosene can, without any material alterations to adapt it to alcohol, give slightly more power

(about ten per cent) than when operated with gasoline or kerosene, but the increase is at the expense of greater consumption of fuel. By alterations, designed to adapt the engine to this new fuel, this excess of power may be increased to about twenty per cent."

"The different designs of gasoline engines are not equally well adapted to the burning of alcohol, though all may burn it with a fair degree of success."

In most localities it is unlikely that alcohol power will be cheaper or as cheap as gasoline power, for some time to come.

Too much must not be expected of the alcohol industry at once; its progress is bound to be slow. There are many problems to solve which will take considerable time.—H. M. Bainer, Professor of Farm Mechanics at Colorado Agricultural College.

DENATURED ALCOHOL FACTORY.

Details for formation of the American Alcohol Company which will enter into the extensive manufacture of denatured alcohol were perfected Monday, and capital to the amount of \$40,000 has been subscribed, principally by Ventura county men, says the Santa Paula Chronicle.

The formation of this company has been steadily but quietly going on for some months, with the result as noted above. The directors are F. Hartman of Ventura, Geo. C. Power of Saticoy, Robert Grower of Los Angeles, Frank Petit and Ben Virden of Oxnard and Emmet Crane of Santa Paula.

In the manufacture, what is known as the Palmer process, is to be used, it is named from the discoverer and patentee, Mr. Palmer, who turned over his right to Mr. Grower, one of the present directors of the new company, which in turn was acquired by the company.

This process is a cheaper and quicker process than any other, and since the government tax has been taken from denatured alcohol, it will be possible to manufacture alcohol cheaply enough to compete with a gasoline and coal oil for fuel, light and power.

TEACHING ALCOHOL MAKING.

At its last meeting the Board of Regents of the Minnesota State University appropriated a sufficient sum of money to install a de-natured alcohol plant at the State School of Agriculture. The purpose is to establish a plant for educational work to the end that students at the school next winter may receive practical instruction in the art of distilling and manipulating the plant, and also learn how to comply with the law and all other points necessary to equip one for running any kind of plant, from a small one to supply family needs only up to a co-operative one of any desired capacity. The plant cannot be installed until the government officials who are charged with the administration of the law announce what sort of device or devices are to be used, and this may not be done before September or thereabouts.

A meeting of fruit growers of the State is called at San Francisco to discuss ways and means of bringing before the government the injustice wrought to the dried fruit industry by the State by a construction of the Pure Food law so as to prohibit the selling of sulphured fruits.

GOODBY, MAYBE.

u hear that graft has got to go, it has been going some). Many an honest alderman has gathered in a crumb, but now the world has grown so good that grafting has to quit, and all the grafters may as well pack up their things and git.

used to be considered quite the thing for honest men to pull coin from the public crib. And then reach in again, and now we have a different code, and statesmen who are shy, they would graft and hold their own, must do it on the sly.

ce on a time, so I've been told, the game was much like tag, and statesmen were not counted bright who didn't get the swag, but now we raise an awful roar, a sort of man-size fuss, any of our public men hold out a stamp on us.

en let us bid farewell to graft, since from it we are free. It's safe to leave a red hot stove without a lock and key. The muck rake now is bearing fruit, we notice at a glance. No longer do our statesmen graft unless they get a chance.—Ex.

A RAINY SUNDAY.

T WAS a rainy Sunday in the gloomy month of November. I had been detained in the course of a journey by a slight indisposition, from which I was recovering; but I was still feverish, and was obliged to keep with-doors all day, in an inn of the small town of Derby.

A wet Sunday in a country inn! Heavily who has had the luck to experience one can judge my situation. The rain pattered against the casements; the bells tolled for church with a melancholy sound. I went to the windows in quest of something to amuse the eye; but it seemed as if I had been placed completely out of the reach of amusement. The windows of my bedroom looked out upon tiled roofs and stacks of chimneys, while those of my sitting-room commanded a full view of the stable-yard.

I know of nothing more calculated to make a man sick of this world than a stable-yard on a rainy day. The place was littered with wet straw that had been kicked about by the travelers and stable boys. In one corner was a stagnant pool of water, surrounding an island of muck. Some half-drowned poultry were crowded together under a cart, among which was a miserable crest-fallen fowl, drenched out of all life and spirits, his drooping tail matted, as it were, into a single feather, along which the water trickled from his back.

Near the cart was a half-doing cow chewing the cud, and standing patiently to be rained on, with wreaths of vapor rising from her reeking hide. A wall-eyed horse, tired of the loneliness of the stable, was poking his spectral head out of a window, with the rain dripping on it from the eaves. An unhappy cur, chained to a dog-house hard by, uttered something now and then between a bark and a yelp. Everything, in short, was comfortless and forlorn.

I sauntered to the window, and stood gazing at the people picking their way to church, with garments carefully lifted and dripping umbrellas. The bells ceased to toll, and the streets became silent. The day continued powering and gloomy; the slovenly, ragged spongy clouds drifted heavily along; there was no variety even in the rain; it was one dull, continued,

monotonous patter, patter, patter, except that now and then I was enlivened by the idea of a brisk shower, from the rattling of the drops upon a passing umbrella.

It was quite refreshing (if I may be allowed a hackneyed phrase of the day) when in the course of the morning a horn blew, and a stage-coach whirled through the street, with outside passengers stuck all over it, cowering under cotton umbrellas, and seethed together and reeking with steams of wet cloaks and overcoats. The sound brought out from their lurking places a crew of vagabond boys and vagabond dogs; but all the bustle was transient; the coach again whirled on its way; and boy and dog slunk back again to their holes; the street again became silent, and the rain continued to rain on.—Washington Irving.

WITH THE COOK.

Tomatoes With Shrimp Filling.

Scoop the pulp from six large tomatoes, and turn them upside down to drain. Brown two slices of onion in two tablespoons of butter; when done, lift out the onion and add the tomato pulp. Cook till quite thick; add one cup of fine stale bread crumbs, mix thoroughly, remove from the stove, and stir in a quarter of a cup of cream, one and a half cups of shrimps cut in small pieces, and salt and pepper to taste. Fill the tomato shells with this mixture; cover the tops with buttered crumbs and bake in a hot oven until nicely browned. Serve each on a round of hot buttered toast. Salmon may be used in place of shrimps if preferred.

To Can Strawberries.

To can a quart of fruit, take two quarts of select ripe fruit. To this add one cup of sugar and a very little water. Do not add too much water, as the berries are very juicy and a great deal of fluid will be taken from them. Place the berries, water and sugar on the stove and bring to a boil. Then put them and the desired amount of juice in the jar and seal as you would any other fruit. Lay the jars on their sides till the berries have cooled and the latter will not sink to the bottom, but will remain evenly suspended in the juice.

Cheese Fondue.

This dish is really delicious and is a good substitute for any meat, containing as it does a large per cent of the tissue elements.

One cup stale bread crumbs; 1 cup milk; 1-3 cup grated cheese; yolks of three eggs; 2 tablespoons butter; 1 teaspoon salt; 1-8 teaspoon red pepper; 1-2 teaspoon celery salt; whites of three eggs.

Put all but whites in top of a double boiler, stir until cheese is melted, when partly cooled, fold in to the stiffly beaten whites and bake in a moderate oven 20 minutes.

Roast Lamb.

The hind quarter of a lamb makes the best roast. Put it into a covered roaster, season with salt and pepper, rub with flour and baste with good sweet drippings and a very little water and cook slowly two hours. The water should have all cooked away leaving the flour browned in the pan. Brown more flour in the drippings and make a gravy to serve with meat. Garnish with parsley and serve with mint sauce.

TRAINING THE FACULTIES.

Nikola Tesla was talking about his student days at Prague.

"I remember well at Prague," he said, "an old professor of great originality and acumen. This professor insisted on the value of a free use of the perceptive faculties, and he was always pointing out the need for this use in strange ways."

"One day, on arising to lecture, he began:

"Gentlemen, you do not use your faculties of observation as you should."

"He laid on the table before him a pot, filled with some vile-smelling chemical compound—a thick, brown stuff.

"When I was a student," he went on, "I did not fear to use my sense of taste."

"He dipped his finger deep into the pot then stuck the finger in his mouth.

"Taste it, gentlemen. Taste it," he said, smiling grimly.

"The evil pot passed round the class, and one after another we dipped our fingers in it and then sucked them clean. The taste of the thick brown compound was horrible. We made wry faces and spluttered. The professor watched us with a grim smile.

"When the pot was finally returned to him, his thin lips parted, and he gave a dry chuckle.

"I must repeat, gentlemen," he said, "that you do not use your faculties of observation. If you had looked more closely at me you would have observed that the finger I put in my mouth was not the one I dipped into the pot."

CITY FOLKS SURPRISED.

A correspondent to the Sacramento Union from Colusa gives the following touching incident: Some San Francisco visitors were the innocent cause of a peculiar runaway accident near here. They had come to look at some land and on the way their automobile evinced that tired feeling which eventually led to the usual halt en route.

While fixing the machine, a farmer came driving up with a two-mule team hitched to a wagon. Attached to the wagon was an empty buggy and tied to the back axle of the buggy one mule.

The two mules didn't shy at the stranded automobile, nor did the driver nor the wagon. Nor did the buggy. But the two-eared party who closed the procession, decided that he would have some fun and planting his front feet firmly on the ground threw himself back with such force that he broke the rope which attached the buggy to the wagon. It left him just enough space to turn around and off he set at a wild gallop, dragging the buggy backwardly by its axle, the shafts flopping in the air, like one in distress. After covering about half a mile in sixty seconds, the vehicle upset and Mr. Mule dragged it sideways for a while until he finally smashed it. The folks had seen many things to interest them, but none so unique as a buggy running away backward with no animal in the shafts.

The Cultivator would like—but not for publication—a transcript of the farmers' remarks to "them chug-wagon fellers."

COOL WATER FOR PICNICS.

The water-bag has supplanted the old-time jug—much to the joy of the fellow who has the carrying of it and to all who are fortunate enough to partake of the contents. The Appell South African Water Bag is a recent invention which keeps drinking water

cool for fully forty-eight hours, and under all conditions, provided the bag is exposed to the air.

It is light, being made of canvas, and when not in use can be folded like a towel and carried in the pocket. Think of it, no jug, no cumbersome canteen to bring home! Every camping, picnic, yachting, hunting or fishing party which has once enjoyed the delight of a cool drink anywhere, at any time, from the Appell South African Water Bag, counts it among the "indispensables;" while it is a veritable boon to prospectors, surveyors, miners, rangers, travelers, farmers, timbermen, threshing crews, millmen, railroad men, teamsters, boatmen, etc. The bag is for sale by all hardware dealers and is manufactured by the Adam Appell Company, of Portland, Oregon.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

The Eucalypts

SILENT, alone, unlike all other trees,
As strangers come from far beyond the seas,
Mysterious, with melancholy sweet
They stand, their noble, graceful forms a page
Wherein one reads a royal lineage.
Straight in a crooked world their course they keep
Starward; their heads in quiet dignity
Rise far above the turbid world, and slow
As beauteous spires and pinnacles they grow,
Fit climax for God's temple-groves below.

—Arthur James Todd in Sunset.

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropico, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,
By E. B. Barry, Manager.

Sociology and Irrigation

Written for the Cultivator by W. A. Beard, Chairman Executive Committee of the National Irrigation Congress to Be Held in Sacramento, September 2-14, 1907

AT THE COMING Interstate Exposition of Irrigated-land Products and Forestry products which will be held in Sacramento September, 2-14, Baker and Hamilton have offered a magnificent silver punch bowl as a trophy for the best display of cereals raised on irrigated land. This competitive exhibition of irrigated land-forestry products will be inaugurated as a feature of the Fifteenth National Irrigated Congress which begins its sessions September 2nd. It will continue a week after the closing of the Congress itself, that is during the continuance of the California State Fair.

The trophy is one of a superb line of magnificent and costly prizes and awards hung up for the same event. The actual cost of the collection aggregates more than ten thousand dollars, and is supplemented by a list of other prizes bringing the total up to a sum in excess of twenty thousand dollars, the largest ever distributed in this way at any similar event in the United States. Among the other prizes in the list is a Holsetein bull of the famous Pierce Riverside herd, valued at \$1000.

The Baker and Hamilton gift is an exquisite bowl-shaped design, gracefully worked out to the minutest detail. It stands 15 3-4 inches high and measures 13 3-4 inches across the top. It is heavy and massive in appearance. The decoration wrought in repousse handwork depicts the various cereals grown in irrigated lands. The inscriptions will be placed in the panels arranged for the purpose, one being reserved for the medal of the Fifteenth National Irrigation Congress.

Important to California.

The importance of the coming session of that body in its relation to the highest interest of California cannot be overstated. No matter from what point of view it is regarded, the influence which it exercises as a factor of both material and social development in the West becomes plain upon examination of the movement in its entirety for which the Congress stands.

If viewed from the sociological side, the bearing of the activities of this propaganda upon the life of the community in all its various phases, impresses itself upon the thoughtful mind.

Make Rural Social Life Attractive.

For the sociologist, indeed, there is no question pressing more assiduously for determination than that of the abandonment of the farm for the city by our young men, and the aversion of immigrants to agricultural life. The question commands so much interest and its answer is so vital to National prosperity that American publicists have come to the assistance of sociology, and we find it engaging the attention of influential men in public life. It is quite generally agreed that the disparity between the social life of the town and the relative isolation of the farm is

largely responsible for this aversion to rural environment.

Of course, there are other influential determinations of the constantly growing disposition such as the larger opportunities for money afforded by the cities and the elaboration of openings for a wider variety of talents and specialization, but when reasonable allowance has been made for these and other conditions, Sociologists, as a rule, are convinced that the disparity in

the social life remains the paramount explanation.

Fortunately the question is being answered and not in the terms of the sociologist student either; true the settlement will meet the suggestion that the social life of the farmer must be improved, but no sociologist has indicated the means by which this reform could be accomplished. Intensive farming is preparing to restore the equilibrium between the impetuosity of urban living and the serener rural life. Isolation, the foe of the social life is to be destroyed for the agriculturists and in its stead the community plan substituted.

Irrigation Will Aid.

In this work the National Irrigation Congress which holds its Fifteenth annual session in Sac-

ramento, California, in September next, is the pioneer. By irrigation the soil will be made to produce its full capacity and it is inevitable that the land will be subdivided and large areas converted into communities. The community begets the social life and the aversion to dwelling on the farm will disappear.

President Roosevelt in his address before the Michigan Agricultural College touched on this phase of the great National movement set in motion by the act of Congress commonly known as the Reclamation Act, which was passed in 1902, in these words:

Roosevelt Says:

"We cannot too strongly insist upon the fact that it is quite as unfortunate to have any social as any economic falling off. Ambitious, native born young men and women who now tend away from the farm must be brought back to it, and therefore, they must have social as well as economic opportunities. There should be libraries, assembly halls, social organizations of all kinds. The school building and the teacher in the school building should, throughout the country district, be of the very highest type. The country church must be revived. All kinds of agencies, from the rural free delivery to the bicycle and the telephone, should be utilized to the utmost; good roads should be favored; everything should be done to make it easier for the farmer to lead the most active and effective, intellectual, political and economic life."

Surpassing Predecessors.

The coming session of the National Irrigation Congress at Sacramento gives every indication of surpassing its predecessors, both in the scope of its work and in the larger area which will be represented by delegations. Advices received at the California headquarters of the Board of Control come from a wider range of country and indicates clearly that the work of the Congress is making great headway among practical men of affairs, as well as among men of science and those in high official position, both in the United States and the nation. Irrigation is one of the influences that are doing things in

this country. California presents abundant examples of the beneficial results that are meeting the sociological requirements in reply to the question raised by the neglect of the farms for the cities.

As a result of the National Irrigation Association's work, begun in 1899, there has been practically \$43,000,000 put behind reclamation by irrigation. In five years that sum should be behind drainage, either through the government or private enterprise. In other words, \$215,000,000 used in drainage would put into cultivation land that is now unfit for cultivation to a greater amount per acreage than the empire of Japan. Shall we reclaim the wastelands and put industrious people upon them to cultivate the soil and add to the wealth of the country?—The New Southwest, St. Louis.

The Water is Measured

THE Canadian government very carefully measures the flow of water in every stream from which water is taken for irrigation purposes—No one can secure a permit to build an irrigation ditch unless the water is there to supply it, and it must be of sufficient quantity to supply it at the season when the flow is least.

That prevents shortage of water at all times and in all places where irrigation flourishes—The result of this policy is that there is no litigation over water rights for everyone who farms has all the water he wants.

Just think of this combination:

All the water you can use for your crops and live stock right in your field at any season of the year, fine soil that will produce almost anything that will grow in the temperate zone, good climate, which assists in producing enormous crops and good health, as good markets as are to be found in America.

All these and more we have in

SUNNY SOUTHERN ALBERTA.

We have as good land as lies out of doors at very low prices, both irrigated and non-irrigated. We are selling this land on terms that anyone can stand.

You will prosper in Alberta—You can't help it if you are willing to work as hard as you now work, because there is everything here to assist you and no draw backs.

If you are laboring under a mortgage—if you are tired of trying to make high priced land pay—if you want to make money easier than you ever made it before—if you want to raise the largest crops you ever saw grow—if you want to live in a good neighborhood, among good people—if you want to enjoy one of the best climates on the American continent—if you want to enjoy the best health you ever had—if you want to educate your children in as good schools as you now have write us and let us tell you how you can see this glorious country at very small expense, and judge for yourself that what we say about it is true.

Now is the time to come, for land is going higher every day—The sooner you buy the larger your profits.

Deciduous Fruit Culture

THE VALUE OF GREEN CROPS.

THE value of a green manuring crop may not always be determined by its capacity for gathering and fixing the nitrogen of the atmosphere. The after treatment has very much to do with it and one crop that is low in power to conserve this element, when worked into the soil properly may give better return than one much richer, but worked to a disadvantage. It is well known that growth when turned under fresh and green rots much quicker than when allowed to become dry before plowing under. The nitrogen in either case is not immediately available, but that which is quickly rotted is more quickly available.

Plow Under Early.

Nitrification must take place before the growing plants can use it. Decay is the first process and by the time the dry material is in form to use, the lush material has long passed into to use. There are two reasons for this. One is, that the dry material consumes more time in decaying, other conditions being equal, and furthermore, the soil is dryer late in the season, retarding the process of decay still more. The most important reason is, that moisture is absolutely necessary in the process of nitrification. The decay of lush vegetable matter in the warm spring weather is particularly favorable to the transformation of the elements into an available form. When the conditions are delayed part the period of the first spring weather, there is not only a shorter period during which the crops can avail themselves of it, but there is liable to be a greater amount left unused in the soil to be washed out by the winter rains.

Vetches are Good.

Assuming the above to be true, the crop that remains succulent latest in the season, other things being equal, is the best for farmers to use. Vetch seems to possess this property to the greatest extent of any of our winter growing crops and fortunately, it is exceptionally high in nitrogen. Of several analyses of vetch, it was found that assuming the value of the contents of the vetch in nitrogen, potash and phosphoric acid from one acre, the nitrogen composed 71 per cent of the value, potash 24 per cent and the phosphoric acid five per cent. Lupines have been known to return to the soil three times as much nitrogen as vetch; still it is not known how much nitrogen each takes from the soil aside from that taken from the air. The vetch seems best adapted to our conditions in several ways.

How Much Nitrogen.

Just how much of the nitrogen comes from the air, that is found in legumes, will be perhaps never be determined. Vetch, for instance, under favorable conditions, has produced 120 pounds of nitrogen per acre; barley has produced 110 pounds of nitrogen per acre, a better showing than most legumes make.

Two such crops giving such close results, would lead us to suppose, one being a nitrogen gatherer and the other not, that the nitrogen gatherer only extracted ten pounds of nitrogen from the atmosphere. This however, may not be so as it has been proven that legumes will, when carrying the nitrifying bacteria, store up an abundance of nitrogen when growing in pure sand in which not a trace of nitrogen is found. Again, all soils

are not equally rich in nitrogen. One soil may be full of it and in a few weeks contain but a small amount.

Varying Conditions.

A French scientist one time found that a certain soil contained 800 pounds of nitrate of soda per acre in a layer of soil near the surface. Three weeks later he found less than 30 pounds in the same soil. In the former case it was during a severe drouth and the latter after a heavy rain. Where nitrogen in the available form is abundant, legumes usually take it readily from the soil and show few nodules on the roots, but where the soil is deficient, the plants get to work and take it from the atmosphere. Should a barley crop be growing in soil rich in nitrogen, it would draw heavily on it. Should a vetch crop be growing on a soil poor in nitrogen, it might not be able to take in so much nor as rapidly as the barley would directly from the soil.

Only one-third the varieties of pears under cultivation are capable of fertilizing themselves. Two-thirds do not fertilize and will be unproductive and unprofitable unless planted near other varieties. Not more than three rows of one variety should be grown together and another variety should be planted alongside these three rows. It is still better if every third row is a different variety. The varieties which do not fertilize themselves are Bartlett, Anjou, Clapp's Favorite, Clairgeau, Sheldon, Mt. Vernon, Lawrence, Howell, Louise Bonne, Souvenir du Congress, Winter Nelis, Bosc, Easter and Superfine. Self-fertilizing varieties are Doyenne, Kieffer, Buffum, Flemish Beauty, Leconte and Tyson. In many cases cross fertilization changes the shape of the fruit and influences the number of seeds. When the blossoms fertilize themselves the seeds may be imperfect. In large orchards of one kind alternate rows may easily be grafted to other varieties.—Field and Farm.

It is apparent to all that the one thing most needed in our soils is decaying vegetable matter. This material is very soon exhausted because of the action of our intense sun. But this is something we must learn to counteract if we are to maintain the fertility of our orchard lands indefinitely. The best way to secure this decaying vegetable matter is by plowing under some form of green manure. Just what this crop shall be, and how it shall be handled, remains to be determined by experiment. A number of people in various localities have been turning under green crops in their orchards for several years and with good results. The possibilities along this line are all before us, and we believe that in the near future great strides in this direction will be made.

There can be no question but that the sulphur, lime and salt solution is a very efficient fungicide. It surpasses anything I know of for cleaning up the trunks of trees and it has a very marked effect upon the freedom from scab of both fruit and foliage.

The knife and saw still remain the principal remedies against the blight. We have not yet found a remedy that may be applied to and cure sick limbs and twigs.

General Agriculture

GINSENG.

OWING to many inquiries which come to the Cultivator of ginseng in this State, we have made many inquiries and still feel that Californians should "make haste slowly" in taking up its culture. Also wishing further information, we have written the Department and have the following reply:

Where Native.

Ginseng is native in rich, moist soil in hardwood forests from Maine to Minnesota and southward to the mountains of northern Georgia and Arkansas, and has been cultivated in small areas from central New York to Missouri. So far as we have any record, ginseng has never been successfully cultivated outside of its native range. No experiments in the cultivation of ginseng are being made by the Department of Agriculture.

Cultivation.

In cultivating ginseng the conditions of its native habitat must be followed as closely as possible. It needs a deep, rich soil, and, being a plant accustomed to the shelter of forest trees, will require shade, which can be supplied by the erection of thatched sheds over the beds. A heavy mulch or similar well-rotted vegetable material should be supplied to the beds in the autumn.

The seed, which is supposed to lose its vitality if allowed to become thoroughly dry, is sown in the spring or autumn in drills 6 inches apart and about 2 inches apart in the row. The plants remain in the seed bed for two years and are then transplanted, being set about 8 inches apart each way. It requires from five to seven years to obtain marketable roots from the seed. If roots are planted a marketable product will be obtained sooner, according to the age and vigor of the stock used. The roots are set about 8 by 8 inches apart. When the roots have reached marketable size they are dug, washed, sorted and dried.

Chinese Only.

Aside from the small amount of ginseng consumed by the Chinese residents in this country, most of the ginseng produced in the United States is exported to China. During the year ended June 30, 1904, the exports from the United States amounted to 146,576 pounds, valued at \$1,69,849. Wild root is worth from \$5.75 to \$8 per pound, according to quality. Roots of southern origin bring less than those from northern localities.

The Department has no seeds or pots of ginseng for distribution. These are advertised in many newspapers and magazines, but the Department can not undertake to recommend or guarantee the reliability of any particular firm. The seeds are usually advertised at from 1 to 5 cents each, and the roots, according to age, from \$5 to \$20 per hundred. A pound contains about 8000 seeds.

Special Conditions.

Since the successful cultivation of ginseng calls for special conditions and unusual care in treating the seed and plants, it is clear that there will be a very large number of failures. Moreover, if a small proportion of those who contemplate going into ginseng cultivation succeed, there is danger that overproduction may ensue, with a consequent fall in price. In marketing the dried root of late, a marked discrimination

against the cultivated article has developed, founded, it is claimed, on the failure of the Chinese to accept it, the wild root being preferred. At this date there seems to be almost no sale for the American cultivated root. How long this condition of the market will continue is not known. All these considerations make it wise for those who contemplate going into ginseng cultivation to look at their prospects with conservatism.

Ukiah will receive \$70,000 from its wool clip this season.

THE SOCIAL FEATURE OF GRANGES.

The social feature of the grange, says the spokesman Review, is one of its strongest recommendations. Legislative propositions may be discussed and advocated at the general meetings; the political situation may have attention, especially from those who like to talk in public; theories on various subjects may be advanced by enthusiasts—but after all it is the establishment of fellowship among neighbors that does the most good and gives light to the farmer's life.

In the local granges the things that are of immediate concern are talked over. Practical suggestions,

based on individual experiences, are exchanged. How best to make the most out of the land is discussed. The women talk over the things in which they are particularly interested. Sociability is developed.

Under proper conditions agricultural phosphate is a very effective fertilizer. The principal of these conditions are good mechanical condition of the soil, a sufficient supply of humus, and thorough distribution of the phosphate in the soil. The use of barnyard manure with the phosphate also increases its effectiveness, and conditions which promote the growth of bacterial flora in the soil favor assimilation of the phosphate.

Irrigation Pumping

is done easily and economically with an

I. H. C. Gasoline Engine

WHETHER you are pumping from deep wells, shallow wells, reservoirs, canals, or running streams, an I. H. C. gasoline engine is the one best power.

It is the best for a number of reasons.

In the first place, it is *easily operated*. You don't need an engineer to look after it—in fact it requires practically no attention whatever—it will run for hours at a time, safely and regularly, and when it does need attention, your small boy or girl can look after it as well as you can.

Next it will *not get out of order*. I. H. C. gasoline engines are made throughout of the best materials, and all complicated parts have been eliminated.

And again, it is *economical*.

Ordinary stove gasoline is the fuel it uses, and it gets all the power out of it and wastes no fuel. And gasoline is something you can always have ready. Buy it by the barrel, and it is easy to keep a supply on hand.

And there are many other features which we can't go on to explain here—durability, safety, convenience, etc. Investigate

them before you buy. It will pay you to know all about them.

I. H. C. gasoline engines are made in various styles,—Vertical and Horizontal, Stationary and Portable, and in sizes ranging from 2 to 20-horse power. When not in use for pumping they furnish excellent power for sawing wood, cleaning grain, grinding feed, shredding fodder, separating cream, etc.

**Clean Skimming
Means Good Living**

The hog trough is no place to put butter.

Wide awake farmer! Want the
cream separator that skims the clean-
est. It means more profit—better
living. That separator is the Sharples
Dairy Tubular—no separator that's
different.

Sharples Dairy Tubulars have
twice the skimming force of any other

separators—skim twice as clean.

Prof. J. L. Thomas, instructor in
dairying at the agricultural college of
one of the greatest states in the Union,
says: "I have just completed a test of
your separator. The skimming is the
closest I have ever seen—just a trace
of fat. I believe the loss to be no greater
than one thousandth of one per cent."

That is one reason why you should
insist upon having the Tubular. Tub-
ulars are different, in every way, from
other separators, and every difference
is to your advantage. Write for cat-
alog S-250 and valuable free book,
"Business Dairying."

Live Stock and Dairy**BUILDING A SILO.**

THE silo may be placed within the
barn under the same roof. This
is the common practice in the
Eastern States. In California it is
usual to have only a milking
and feeding shed for cows. The barn
not existing except as the ranchman
told the tenderfoot: "Yes! Of course
you can sleep in the barn there it is
all outdoors with the sky for a roof." The
silo therefore we will consider as
an outdoor structure. The round silo
is now admitted to be the cheapest
and best, it is more durable as a build-
ing and the best conservator of the con-
tents. I will take it for granted that
this statement will be admitted and
not quote the figures of the Experi-
ment Stations on this matter.

Minnewawa Silos.

We have two silos: a round one
thirty-two feet high and twenty-six
feet in diameter, built in 1896. The
old silo, built in 1894 is a building
thirty-six by sixteen feet divided into
two pits, sixteen by sixteen feet and
twenty-six feet deep. The corners
are cut off so it makes the pits ir-
regular octagons. This shape is waste-
ful of the ensilage at the angles and
is much harder to pack solid. We
have abandoned its use and are going
to take off the sides and lower the
roof to make a shed for the cows to
lie under during the heat of the day.
We are waiting until the winter when
the lumber will be damp, then the
boards can be carefully removed with
out splitting and will be useful for
fencing as they are all in sixteen-foot
lengths.

Silos in California are usually built
of wood, while in the East, brick, or
stone and lately concrete and hollow
block are being largely used. My per-
sonal experience has been with wood-
en silos, I am going to give that first
and the following description is the
actual way we proceeded. I had never
seen a silo before. We built the square
one and that was the only one I
knew about when we built the round
one. At that time builders in the
East were not selling specifications
and plans, all we had was a written
description and a picture of the com-
pleted building.

Site of the Silo.

In selecting the sight for the silo
there are several points to consider.
I would not have it directly in the
barnyards as the cows make the
ground around it foul in the muddy
weather. Our square silo is directly
in the barnyard, while the round one
is across the fence from the feeding
yards. Plan to have an overhead
trolley to carry the feed to the man-
gers. Trolleys to handle manure, hay
and silage around the barns must
come more and more into use, it is
well to plan for these as well as for
trolleys to carry the milk to the sepa-
rator from the barn. When I began
farming in the San Joaquin Valley we
all grew wheat as we lacked laborers.
Then came the Chinese and by their
labor the vines were planted and
handled. We have never had in the
last twenty-one years, except during
the two years of the greatest financial
depression, white men enough to do
more than handle the teams.

Improved Machinery.

In the dairy we can lessen the hand
work and expense greatly by

Veterinary Instruments, Black Leg and
Anthrax Cure, Milk Fever Outfits... See
O. J. Weber Co., 555-557 S. Los Angeles
street, Los Angeles.

using machinery rather than doing
the work, by grunts, and sheer force
and awkwardness. This is too old-
fashioned in this day of rapid move-
ment. Even the cows must take on
a more rapid motion. The trolley,
therefore, with the milking machine,
and the separators all mean increased
efficiency and are bringing dairy
work into the lines of a skilled occu-
pation. The men used should be
those of brains, paid better and men
that will use their brain to help us.

Size of Silo.

It is estimated that a cow will eat
in two hundred days, four tons of
silage, therefore a cow may be said
to eat about five surface feet from a
silo thirty feet deep. I have found,
however, that it is much better to
keep the cows in cool shady places
during the heat of the summer time
and feed silage rather than pasture.
Then it will require six feet rather
than five feet per cow. True our silos
are not straight corn, but have lawn
clippings and first crop of foxtail al-
falfa in them. This is not always
good feed and the cows are wise
enough only to eat the best.

One Hundred Cows.

A silo to feed a hundred cows should
be twenty-six feet in diameter and
thirty two feet deep. Two such silos
will easily keep two hundred cows and
the calves in silage by the year. In
the larger silos the loss is less from
outside waste and there is only one
top layer to be thrown into the ma-
nure pile. A fifty-cow silo should be
twenty feet in diameter and thirty
feet deep. Two of this medium size
are often better for the hundred-cow
dairy than having all the feed put
into a large silo; for while there is the
loss from the greater surface, there
are often times when the crops are
not large enough to completely fill a
large silo, that makes it worth while
to have a smaller one. To make good
silage the mass must be great enough
to give depth to produce pressure and
raise the heat and to exclude the air.

Drainage of the Ground.

The ground on which the silo stands
must be high enough to avoid stand-
ing water after sharp showers. If the
ground is high enough sometimes it
may be well to make the silo pit six
feet into the ground. If there are no
rats the silo that stands above ground
need not have a cemented floor. We
have not found it necessary to have
cemented floors in either of our silos
so far. The earth is a little mounded
up on the inside keeping the lowest
portion higher than the outside
ground. Inside the earth is highest
at the walls of the silo and gently
slopes to the center. If the floor is
cemented then a drain should be pro-
vided. A two-inch tile answers the
purpose. Carry it out through the
foundation wall giving a good slope
and cover the end with strong wire
netting to keep the gophers out. When
the ground is sandy and is not ce-
mented it readily absorbs the moist-
ure from the silage. There may be
soils in California too close in tex-
ture to take up the moisture, these
should have a drain.

Foundations.

It is foolish to think of standing a
silo directly on the ground as the
moisture rising and meeting the mois-
ture from the silage will make a fine
bed for molds and decay. The wooden

portions should be kept well clear of the ground, standing on a good brick or stone foundation. After selecting the ground for the silo drive a crowbar firmly down in the center, slip over it the looped end of a rope. The loop should be large enough to turn freely. Then measure off half the diameter of the silo on the rope and tie at the end a sharp strong stick. Now walk around the circle and marking it off with the stick held by the right rope. Dig out a trench wide enough for a wall three bricks wide. Be careful to keep it in a perfect circle. Use the stick held by the rope and crowbar to run around the end of the bricks as they are laid to keep the circle true. This circle must be always an exact number of feet as the studs must be a foot apart, and the sills and plates are cut two feet. The measure is made on the outside lines of the circumference. Take a scantling the width of the sills and nail at each end a block of the same heights about two feet. Use this first in the trench then for brick work and on the brick wall to keep the level, by laying the ordinary spirit level along on the scantling the brick work can be kept reasonably level, and little faults are easily corrected by using more or less cement.

THE FUNCTION OF HOG'S LEGS.

The hog's legs perform a function not known to any other animal, and that is an escape pipe or pipes for the discharge of waste matter or sweat not used in the economy of the body. These escape pipes are situated upon the inside of the legs, above and below the knees in the fore legs and above the gamble joints in the hind legs, but in the latter they are very small, and the functions are light. Upon the inside of the fore legs they are always active, so that moisture is always there about and below these orifices or ducts in the healthy hog. The holes in the legs and breathing in the hog are his principal and only means of ejecting an excess of heat above normal, and when very warm the hog will open the mouth and breathe through that channel as well as the nostrils.

The horse can perspire through all the pores of its body, such as a man, and cattle do the same to a limited extent, but the hog never. His escape valves are confined to the orifices upon the inside of his legs. People often wonder why it is that the hog dies so suddenly when he runs rapidly or takes quick and violent exercise by fighting. But when you consider the few escape pipes, their small capacity and remoteness from the cavity where the heat is generated, the wonder is that he does not die quickly when overheated.

SELECTING A BOAR.

A great many farmers and breeders make a great mistake in selecting the breeding boar. They wait until they need the boar for service, and then, late in the season open correspondence with several breeders for a boar large enough for service. When the breeder receives such inquiries all the best pigs have been sold and only the culls remain to select from. The result is a boar is ordered, and does not prove satisfactory. The buyer can do no better and the inferior boar is used in the herd and a lot of inferior pigs is the result. The proper way to insure the best results is to select the breeding boar when a pig. The formation of the sows to be bred should be carefully studied, and the boar should be selected to counteract and improve any defect in the sows. If the sows or a considerable portion of them should be a little deficient in back, then a boar with extra good back should be selected. Breeding is a science and requires a great deal of study to make the proper crosses.

Every breeder should become familiar with the standard of the breeds in which he is interested, so as to be able to detect any defect in the breeding animals, and learn to discriminate between the essential points and the non-essential. For instance, some tenderfoot breeders would not use a boar in their herd that was not marked exactly perfect to a hair. This is the color craze. A great many new breeders of Berkshires are liable to be led off into this fool craze, and sustain heavy loss in consequence. It is very desirable to have a boar well marked, but not essential. A good breeder will never sacrifice a good back or a ham for a black foot or a black tail or a small white spot on body.

Did you ever stop to figure out how much you lose by not knowing exactly what your cows are doing from day to day? Do you ever sit down and study hard as to why your herd gave 300 pounds of milk one night and morning and only 273 pounds the second night and morning following? Did you ever add a fresh cow to your herd and find at the end of a week that you were getting only as much milk as you were before the fresh cow was added, though you had fully counted upon maintaining the original flow and being better off by just one cow's milk? How often were you successful in getting the herd back to its former flow under these circumstances?

Be as clean in caring for the stable as you are in caring for the pails and cans.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

High-Grade Farm Wagons

GOOD wagons are absolutely necessary on the farm.

Remember that paint may hide a multitude of deficiencies—a lot of poor materials, particularly poor wood stock—and that the well painted but cheap and poorly constructed wagon may not be a bargain at any price. Break-downs are expensive, repairs cause delay, and in the end the cheap wagon will prove a most expensive one. Iron of the best quality; wood stock of desired toughness, thoroughly seasoned, are required for the big loads, rough roads, ruts, slips and slides that try the farm wagon.

The iron and wood must be put together properly to give the greatest durability.

That's not all; this excellence of material and building must be combined with light running qualities to make the completely successful farm wagon.

All these requirements you will find in the International Harvester Company line of farm wagons.

The Weber for more than fifty years has been among the best and most favorably known of America's farm wagons. The most carefully selected and sea-

soned materials with superior construction in every part make it suit every condition of wagon service.

The Columbus is a strong, well constructed and durable wagon, such as will well meet the needs of the great army of farm wagon buyers and users.

The Bettendorf is a new and valuable improvement in wagon construction, the front and rear gears being made entirely of pressed steel; therefore, the axles, bolsters and other gear parts are free from swelling, shrinking, rot, etc. Ideal for hot or dry climates.

They are the only steel constructed farm wagon gears on the market. These wagons are built to last. Almost any wagon can be guaranteed for a year, but the point that should always be considered is how many years is the wagon likely to do good service? Think it over. It makes little difference which of these wagons you buy. You will make sure of wagon value and wagon satisfaction in any event. You simply can't buy any thing better at any price.

Call on the local agent or write nearest general agency for illustrated pamphlet, describing the wagon you prefer.

The Ornamental Garden

WHY SO STINGY WITH THAT FRONT YARD.

ARE YOU one of those unfortunate mortals who cannot see any special beauty in well grown specimens of flowering or ornamental plants? Who would as soon, in fact, in some cases rather, see a row of cabbages in the front yard as anything? If so, we commend the following, from Wallace's Farmer, to your consideration:

A farmer built a fine house and filled it with good furniture. He had a splendid yard, an ideal place to fix up. He could have made a fine park of it so it would have been equal to a rich man's estate in a city suburb. He consulted a nurseryman, and he made a very low estimate of forty dollars to begin with. The farmer threw up his hands in horror at such a "hold up," as he called it.

Hot Shot.

When he was building he spared no expense, and when he came to furnishings he was generous. There was a big lookingglass that cost twenty-five dollars; a rug on the parlor floor cost fifty dollars. But the moment he stepped out of doors where there was room to do something, then he balked. He wanted five-cent shrubs and flowers to match that fifty dollar rug, and a tree that cost over twenty-five cents was an outrage. Mr. Nurseryman opened up on him with hot shot, but for safety told him he had better hide when the fool-killer came that way. Said he: "You put \$4000 in your house. That is all right. You could afford it. You put in \$1000 worth of furniture. That was good. But when you step out in to God's great parlor of all out doors and we want you to have your yard decent and match His rainbows and sunsets, His fields of green, His lakes and wild flowers, then you get on that stingy streak. What do you mean by it? Here are two acres you have kept for your hog pasture and dilapidated machinery, and your cattle yard comes up to the house, and you prefer to raise flies instead of flowers. Don't you know that from the moment you enter your house it depreciates in value? Use that furniture a year and it becomes second-hand. Out in that yard you plant a Colorado Blue spruce and in a few years it will be worth \$100. Plant some majestic tree lilacs that in June will wear crowns of glory; put in some large beds of peonies and phlox and other hardy perennials, plant \$100 worth of choice stock, and in ten years this farm would sell for \$1500 more than it would with this yard as it now is. Plant in masses. Don't be so stingy."

"Well," replied the farmer, "I am not interested in these things. My hogs and cattle are good enough for me."

From Earth's Center to Stars.

"Well," was the reply, "you are just insulting God. He trusted you with this piece of land, which reaches to the center of the earth and up to the stars. He has a pattern of what this place might be. You just get the pattern and work up to it. Standing all around you are forms of beauty waiting to come in and glorify your home, and you won't let them come. You profess to be a Christian. Did you ever think what you must endure hereafter when you reach 'Sweet fields beyond the swelling flood and

never withering flowers?' Oh, how lonesome you will be when you don't find any Berkshires or Short-horns up there. Don't you know you are doomed to be imprisoned with beauty forever? You can't get out sight of it. The great city is full of it, and if you look out, the whole universe is planned like an immense flower garden. All the rays of light are used up in the star mantles, and the mighty milky way will be as tremendous fields of radiant ever-blooming flowers. Now, you might as well get acquainted with beauty down here and have your home at least slightly suggestive of the home over there."

Allee Samee Overalls.

Well, that hit the man a staggering blow. He didn't know what to say. It was hard for him to reconstruct his life in a moment. The nurseryman added: "You are doing well; you have made a good beginning indoors—you are not as bad in the house as you seem out of doors. Only don't have one suit of sentiment for the house and another for outside which you put on as you do your old overalls."

It Soaked.

"Well, I'll think it over. Call again next week. I'll let this soak in." And it soaked in. When his friend called again he could hardly keep up with him. He wanted this thing and that thing, and before the nurseryman left he planned for a group of fifty different kinds of lilacs, which are wonderful in diversity of foliage as well as blossom, reaching from early spring till the first of July in their time of blooming. He had another group of spinas—twenty kinds; another of twenty kinds of syringas, besides a group of the glorious snowball family. He ordered flowers galore, not stingy little clumps, but masses. The man seemed suddenly converted to a love of the beautiful. And as time went by he found farm work dull and irksome, and he spent most of his time in that front yard among the glories of the floral kingdom—a new land seemed to open before him. He had been a stranger to his own farm; now he was getting acquainted with it. His front yard was a mine full of precious things—the very earth jeweled with beauty.

TRAILING PLANTS.

All plants which trail on the ground or grow sideways, like verbenas, phlox and ivy-leaved geraniums, must be trained or tied down to fill the more open spaces they are expected to cover. This operation is called "pegging down" by the professional, because in former days the trailing was effected by little forked pegs; but there are many ways of pegging without the use of pegs at all; and one of the simplest which I have seen a gardener perform with verbenas is to take hold of a flower truss in bud, make a hole with a stick, or with two forefingers and poke the truss down in it. The shoot is then held in the right position at once, and without knowing how the thing was done, no one could make out that the shoot did not grow naturally in that position from the first.

Those who would prefer to adopt more modern methods must purchase the pins now sold for the purpose.—Farm Stock Journal.

The Vegetable Garden

STAKING TOMATOES.

TOMATOES can be staked or racks provided in the following manner: Take a hoop of a nail keg and tack it to two stakes which have been driven into the ground near the plant so the hoops will stand about eight inches from the ground and completely encircle the plant. As the plant grows draw the branches up over the hoop and when it has reached its growth the hoop will support the vine so none of the fruit will lie on the ground.

Another Support.

Try using a single stake for tomato plants if trellis or other support is inconvenient for each plant. Simply drive a stout stake about four feet long into the ground and set out a tomato plant at each stake. Nip off the bottom branches and allow the plant to grow so as to make its branches near the top, which will protect the fruit from rotting.

GROWING SWEET POTATOES.

Sweet potatoes may be grown on nearly any good upland soil, but warm sandy lands, if fertile, produce the most. A good quality of gravelly ridge land is very suitable. Do not select wet bottom lands. Unless the land is already in first-class condition, it may be improved by working in well-rotted manure. To every acre of this add about 640 pounds of acid phosphate, 260 pounds nitrate of soda and two pounds sulphate of potash, well mixed before you apply. On some lands dried blood and cotton-seed meal are preferred to nitrate of soda. Don't fail to get in at least some potash.

FIGHTING MELON APHIS.

Fred K. Maskew, deputy State Commissioner of Horticulture, was here last week distributing 100,000 lady bugs to battle with the destructive and pesky aphis, says the Coachella News. The visit was the result of an appeal from the growers' meeting a week or so ago to the bureau for assistance in controlling the aphis. In 24 hours after this appeal was wired to the commission the bugs were coming for the battle and in less than a week Mr. Maskew was on the ground. These 137,500 bugs represent a very large force of aphis eaters as they multiply very rapidly.

GARDEN WHEEL HOES.

According to an experienced gardener, there are many styles of wheel hoes, and all of them are good and will pay if well used. Where one has long rows, say a hundred feet or more, it is all right to use a horse hoe or small garden plow. In twenty or thirty minutes one can go over a large garden with one of these and do good work. We use one of these plows after a rain and then in a day or two go up and down the rows with an ordinary garden rake or the toothed hoe spoken of, and, in this way the ground is kept in fine tilth. Sweet corn planted any time during July will make excellent roasting ears.

The first tomato known to have come to the United States was brought to Philadelphia in 1798 from San Domingo. It was a curiosity only, not being regarded edible.

The demand for blackberries is more rapidly increasing than for any other small fruits at the present time, and they may be grown profitably on a great variety of soils.

GOOD GARDEN TOOLS.

Good tools are a necessity in garden work, as in most other occupations. We last year got hold of a new style of hand hoe, or rather a cross between a hoe and a rake, that we like very well. It has eight or ten teeth that are arranged in a sort of spring harrow form, and it can be drawn down between the rows and leaves the ground in fine shape. Of course it must be used before the ground gets hard, but in a day or two after every rain, just as the ground gets in good working shape, a lot of work can be done with this tool in a few minutes.

Among the new varieties of lettuce tested during the last five years, the Wonderful seems to merit its name because of its capacity to produce large cabbagelike heads, lasting well into hot weather under most ordinary culture. Some of the heads grow considerably over two pounds in weight, and are of excellent quality. This is the most vigorous and reliable garden lettuce we have yet found. There are a legion of varieties, many having general merit, while others seem only adapted for special conditions and tastes. For an early, loose-leaved kind, there is none superior to Blackseeded Simpson.

Originating new varieties of potatoes from the seed boll is a matter of great importance to the potato industry. It frequently happens that not one out of many thousands will prove of any great value. All the labor of growing and proving these seedlings is lost, and when the originator does get a really valuable seedling potato, he has to put the price high enough to cover the cost of all expense of the thousands of worthless ones he has had to bring forth to find the one of real value.

Purple raspberries are intermediate in character between red raspberries and black raspberries. They are supposed to be hybrids between these two species. They show all gradations in habit between the two parent types, some being propagated by suckers, others by tips, and still others by either tips or suckers. The color of the fruit is usually a light or dark purple.

There are several things that one may plant in the garden that do not need to be planted every year; in fact, some of them when once planted are apt to stay in good, healthy condition for many years. There is the rhubarb plant, for instance. It is up and growing in the early days of spring, and before you are aware of it some day you find a dish of sauce or a pieplant pie on the table.

Celery growing is one of the most desirable occupations for persons who desire to live outdoor life. There is something so clean and appetizing about celery, while it is growing, that renders its culture a source of refined employment. There is, perhaps, no other line of gardening that will give so prompt returns or prove so satisfactory as a source of extra income.

Common salt sprinkled on cabbage leaves will kill off worms and destroy their eggs as well. The salt application will have to be renewed after every rain. This is a simple and effective remedy, and it does not injure the plants either.

PARCELS POST.

It is exasperating to read, as often we must, of a parcels post treaty with some foreign country. The last instance is such a treaty with Ecuador, which means that the citizens of that insignificant little country may send packages by mail to any part of the United States for from one-third to one-quarter as much as it would cost to mail the same weight 10 miles in our country. We now have a parcels post treaty with many foreign countries, but there is no disposition to give our own people a valuable postal facility that is given to foreigners almost without the asking. It is strange that our people rest so easily under this neglect of a very important interest.

BE EASY.

The Southwestern Farmer hits off the "Ignorant farmer" grind as follows:

"If there is anything that makes me want to cuss it is to hear some pin-headed bundle of balloon juice talk about the 'poor ignorant farmer.' It's a wonder to me somebody don't land on these insects with a hoe handle. If you will investigate these 'sympathizers' you will find that they have made a failure of everything they ever tried to do. A man who thinks the farmers of Texas are either 'poor' or 'ignorant' hasn't got sense enough to do anything but talk rot."

Garden seeds are slow to germinate and the weeds are quickly up; and then the struggle begins, and it is only the perserving that come out victorious in the autumn days with an abundant harvest as the result of their toil.

It is healthful to get out and delve in the soil, and would be a great boon if we carried it on to even a greater extent.

There is always a sense of satisfaction in hearing abused those one dislikes.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

New System of Irrigation Flumes

Made of 2-inch iron tubing with holes any desired distance apart. Easy to lay, requires no repainting.
Cheaper Than Wood Flumes

Will last for years. Can furnish in any quantity. We also carry in stock several thousand feet of all sizes of standard pipe, and a general line of second-hand machinery. Engines, Pumps, Hoists, Pulleys, and Belting of all kinds.

R. Kelly Machinery Co., Cor. Mission Road and Macy St., Los Angeles, Cal.

Irrigation and Forestry

IRRIGATION IN A HUMID STATE.

FOR many years those who lived in a humid state with forty to sixty inches of rainfall—laughed and jibed at the poor fellows who were compelled to irrigate to keep from starving. When the National Irrigation Congress, at one of its meetings, swung out the banner, "Irrigation is Cheaper than Rain," here was a united howl of derision heard all over the East and the South. And they continued to pity the poor devils that had to irrigate.

However, the irrigation propaganda was spread all over the land by newspaper and magazine articles, telling of the vast benefits to be derived from irrigation. How it was a complete and absolute insurance against drouth. Still the people did not believe what they were told. But the persistency of the educational propaganda began to set some, who had more brains and more energy than the ordinary run, to thinking and investigating.

Then at last government documents on irrigation began to come from the press, clothed with the authority of the government officials, who are strictly men of science, and whose deductions are made up from hard, stern, cold facts. Then the humid land farmer began to think, seriously and earnestly. Then he proposed to try an experiment or so. He did, and was amazed at the result. Here is what one man is reported to have done down in wet, humid Florida, as told by the Kissimmee Valley Gazette:

R. P. Hansen, the Cypress Island trucker, continues to ship beans, beets and other vegetables. Mr. Hansen has already shipped over four hundred crates of beans for which he gets \$12.50 per crate delivered at the express office here and reports his vines full of bloom preparatory to putting on a second crop. From one third of an acre he has sold about three hundred crates of beets at \$1 per crate, and has some still left for shipment. Mr. Hansen's crop was raised entirely by irrigation, as there has not been sufficient rain to wet the ground since it was planted.—Redlands Citigraph.

HOW THE NATIONAL FORESTS SERVE THE PUBLIC.

"The use of the National Forests," a publication just printed by the Department of Agriculture, is a brief, clear manual for public information as to the forest policy of the National Government.

It is too true, as the short preface to the public says, that "many people do not know what National Forests are. Others may have heard much about them, but have no idea of their true purpose and use." It is the object of this publication to explain just what the National Forests mean, what they are for, and how to use them.

In the first place, it is explained how the Forests are created and how their boundaries are drawn. Next, their direct use and value are shown from the point of view of the homeseeker, the prospector and miner, the user of timber, the user of the range, the user of water, and other users of Forest Resources. Third, it is shown how the Forests are intended for

use for the production of usable products, and for the establishment and maintenance of homes; how on all of them the timber is protected from fire, the water flow is kept steady, the forage on the range is increased and guarded from abuse; and how, in addition, they serve as great public playgrounds and as breeding places and refuges for game. Finally, the management of the National Forests is described.

Here it is that the great usefulness of the Forests is brought out most clearly and strikingly; for the Forests are managed by the people in their own interests, and every means is used to meet the desires and wants of a Forest users half way by dealing with them in the main directly on the ground and in all cases with the utmost practicable dispatch and freedom from red tape.

In a word, the special interest of this manual lies in its showing that the Forest policy of the Government, both in principle and in practice, for the benefit of the ordinary man for the benefit of every citizen equally. There is still a tendency to think of the National Forests as "preserves" closed to use, and to leave the public lands exposed to unregulated individual exploitation. When these misapprehensions still prevail "The Use of the National Forests" will go far to correct them.

The book is written by Mr. Frederick E. Olmstead, whose intimate knowledge of conditions in the West and the policy under which the National Forests are managed especially fits him to deal with the subject.

SAWMILL STATISTICS.

A compilation of the reports received from over 10,000 sawmills in the United States upon their operations in 1905 shows the proportion of lumber kiln-dried and the proportion surfaced, the amount of slash wood sold and the proportion of log cut on lands belonging to the sawmill operators. No figures along these lines are available for New York, and none are given for several of the States in which the cut was very small.

The States in which the large proportion of lumber is kiln-dried are South Carolina, with 51.3 per cent; North Carolina, with 36.5 per cent; Florida, with 35.1 per cent; Alabama, with 34.8 per cent; and Georgia, with 30.6 per cent. In other States the amount is less than 30 per cent. Altogether, 1642 mills reported the use of dry kilns.

A large amount of the pine cut in the South is kiln-dried in order to reduce its shipping weight. Kiln-drying is practiced to a less extent in the Rocky Mountain and Pacific Coast States, and very little lumber is kiln-dried by the sawmill operators in the hardwood region or where the cut is principally by portable mills. For the country as a whole about 5 per cent of the lumber cut is kiln-dried at the mill.

A much larger proportion of the cut is surfaced at the mills than is kiln-dried. Of the mills reporting, more than 3900 surfaced a portion of the cut. For the country as a whole, at least 35 per cent is surfaced before it is shipped. In this respect Iowa leads, with 77.2 per cent surfaced; but this is because of the lumber cut in that State is in a few big mills along the Mississippi which operate exclusively on Northern pine. As to the States in which the larger proportion of the cut is surfaced at the sawmill are Texas, with 71.7 per cent; Louisiana, with 68 per cent; Idaho, 59.4 per cent; Montana, 55.2 per cent; and Arkansas, with 50.6 per cent. In all the other States less than half the cut is surfaced by the sawmill operators, and as in kiln-drying, a relatively small proportion of the total cut is surfaced in the hardwood regions.

With the Citrus Growers

PRUNING THE ORANGE.

WE HAVE been asked to give directions for pruning the orange. This has been discussed quite frequently in the Cultivator and there are few, if any, additions or changes to be made in the pruning of the orange.

Now is the time to do this work on Navel trees where severe cutting out of the centers is not contemplated. The proper time to do the yearly pruning that is systematically followed, is immediately after the fruit is picked. Pruning of Valencias will come later in the summer.

Formerly Condemned.

Not many years ago, pruning the orange tree was condemned almost universally. Growers who were considered the best authority grew poetical in their protests against pruning and no doubt their convictions were strengthened by the thought that they were inspired to give a solemn warning against a dangerous practice.

During past seasons of heavy crops nearly every orange grower had to prop his trees to keep them from breaking down. Few props have been used in recent years owing to light crops, but we are acquainted with one grower who has succeeded in raising year after year ten to twelve packed boxes of oranges per tree and never uses props. The heavy crops are partly due to the method of pruning, and his being able to dispense with props is entirely due to pruning. This is surely a strong argument in favor of the practice.

Some Suggestions.

All branches that are trailing on the ground should be removed or cut back so that they will not be borne to the ground with a load of fruit. Fruit that strikes the ground or rests on it is unfit for market except as low grade. Branches that project beyond the general outline of the top should be cut back some. It is often advised to remove such branches entirely, but we do not think it well to do so. These branches come in the process of natural enlargement of the tree, and will not continue to grow to the exclusion of other parts of the tree. Other branches will make a like growth and with judicious pruning of these branches, so as to strengthen them without bringing them back to a level with the surface of the tree, the size of the tree is more rapidly increased than when confined to the finer and more numerous growth that annually covers the whole surface of the tree. These strong leaders will form a more open frame and one which will be more easily pruned in the future, than will the more numerous and finer growth.

In cutting the leaders back, remove the strongest branch, cutting it back to a fork. This leaves no stub and "suckers" will not start. This will make a rigid frame that the winds will not sway and heavy crops will not break down even when no props are used. This method is not advised from a theoretical standpoint, but has been proven to be the best way known by several of the most successful growers. So much for "bending the twig in the way it should grow."

Cut Out Dead Twigs.

Mature trees that have never been pruned, or not for several years, are sure to be full of dead twigs in the center. There are to be found twigs in every stage of uselessness from those dead to those with a few

leaves and too weak to hold their blossoms. By going through the tree at this time of year all of such wood can be distinguished from bearing wood and can be removed. Many branches will be strong and vigorous and have no fruit. These should be left, and the weak and slender barren twigs and small branches should be removed. All branches that are in a dense situation and full of dead twigs should be cut out.

Never leave a small branch on a heavy stub in the interior of the tree. It will soon die and will have to be cut out again—cut such limbs close up to the main branch. Keep in mind that you want to get some light into the center of the tree, but not enough to allow you to see through them from a distance of a few feet. There is a happy medium between this state and the dense dark center. If this medium condition is attained, the trees will, other things being equal, produce fruit on the inside. If the tree is made too open the fruit will become lighter in color. Every grower knows that fruit grown in the shadiest part is the best.

Don't be Discouraged.

Any one who tries to follow directions in pruning will be discouraged at first. They will have in mind some particular condition and will not find it as they expect. No two trees are alike and even the most experienced pruner will stop and study his first few trees at the beginning of each season and will have more difficulty with them than all of the balance. The novice will be afraid of cutting too much and will in most cases not cut enough. It is better to cut too much out than too little. In the former case the tree will right itself and in the latter it will not.

ORANGE CULTURE IN FLORIDA.

A view of the citrus conditions in Florida is afforded by the following, from the Tampa Times:

There is nothing more certain than that the cloud under which the cultivation of the orange just now lies in the public mind is undeserved. It is true there have been some cold nips, some dry spells, some groves neglected and some utterly abandoned.—But there are many groves which have been skillfully and painstakingly attended to and which are paying bigger profits than ever. The problem needs investigation and discussion. We venture as a starter that the same energy and trouble given to orange culture as to the average business in which men engage would result in an almost universal success.

If a man will find a suitable location, set his trees right, cultivate and fertilize them properly, attend to them at every stage of their growth, supply them with water when they need it, he is as sure to succeed and make money as in any other business in the world. There are reasons for believing that the lake regions of Florida possess advantages for orange growing which ought to be taken into consideration. They furnish a larger proportion of the hammock land which gives a smooth skin, brilliant coloring and early ripening. They afford a better protection in winter, by reason of the thicket windbreaks and the modifications of the cold by the influence of the waters. These are sufficient to make the difference

very often between profit and loss. Less danger from cold, less fertilizer necessary, a more beautiful, saleable and earlier ripening fruit—these are the advantages claimed by the people who grow oranges in the lake region and in the vicinity of large running streams.

Of one thing we are very well assured, and it is that careful selection of land and varieties, abundance of water in the dry season, regular and careful cultivation, the application in plenty of the right kinds of fertilizer, careful disposition of the product—in short, the same careful handling of the business a man gives to selling goods or sawing lumber—will restore orange growing to the rank of the most pleasant and profitable industry in the State of Florida. This is a view of the subject which should be vigorously pushed in this State.

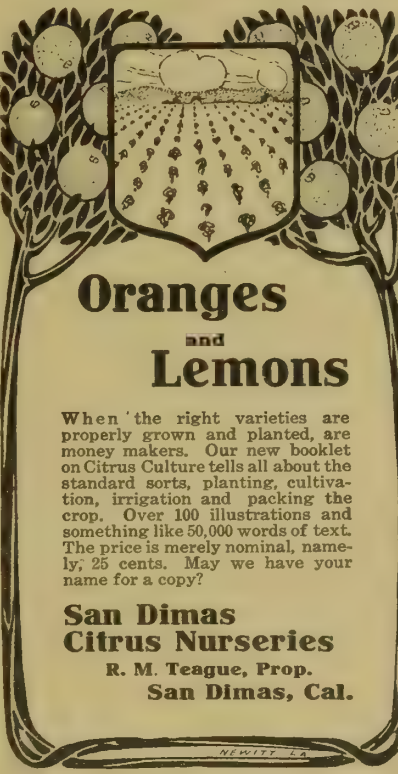

FLORIDA ORANGE GROWERS GETTING WISE.

A meeting of representative orange growers was held at Tampa on Thursday of last week, when an organization was partially perfected. Mr. E. F. Sperry, of Orlando, was elected president, and Mr. E. S. Anderson, of Auburndale, secretary, and a committee appointed to prepare a charter and perfect the organization. The capital stock is to consist of \$10,000 divided into shares of \$5 each.

The purposes of the organization were explained by Mr. J. Varn, of Bradentown, who declared that though other industries had organized for their mutual protection and advancement, the orange growers of Florida were without proper combination and he urged them to come together on the matter, though they are Democrats, Republicans or of other parties. Perfect an organization, call it what you may, trust, if you please to so name it, but so effective that it will protect the growers from unjust competition, commission men's oppressions, railroad overcharges and delays, and the kindred ills which the orange growers of Florida have ever suffered. He

claimed that if the growers would unite in a stock company or corporation with even a goodly sized minority of the orange men in it at the beginning, it would prove of vast benefit to the grove growers and soon enlist the entire orange growing interest of the State into so effective an organization as to protect it and market the crop with profit.—Florida Agriculturist.

There is a difference between pruning and cutting off limbs. Pruning generally helps trees, but cutting, as it is done by the average attendant, is no better than butchery. Read a few reliable books on pruning, then visit a few successful orchardists and how they perform the job before you attempt it.

Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

INDEX.

Call has often been made upon the Cultivator for an index to its valuable contributions. The value of the paper will be largely enhanced by the index. Hereafter a complete resume will be made to each volume.

There are two volumes each year, ending with the last number in June and December. In this issue is a complete index of all articles appearing from January to June. This should have appeared in the last of June issue but it was impossible at that time. Those who have kept a file of the C. C. may cut out the index and attach to the last of the former volume.

In the issue of Dec. 26 will appear another for the volume now running. Subscribers not formerly filing the Cultivator may now find value in the old papers. They contain a vast fund of information.

CO-OPERATIVE DIVIDEND.

That cooperation among farmers may be productive of very desirable results is evidenced by the farmers cooperative association of Rockwell, Iowa which has just declared a dividend of 41 per cent on its capital stock for the year. We do not know of any better dividend—except Standard Oil and Steel—earned by corporations anywhere, and it goes to show what farmers can do when they organize for a specific purpose. The Cultivator has always contended that cooperation among farmers, when intelligently directed, may be made productive of excellent results. Recently there came to our notice a co-operative movement among hay and grain growers in the San Joaquin Valley, which has resulted in bringing

the price of hay in the field to a higher figure than has been paid for several years past. The real truth is that for the first time in the history of our farming community producers are able to name their own figures for their products, and the result will be greater increased bank accounts for those who work under the cooperative system.

HEALTH CONDITIONS ON THE FARM.

Several persons have complained to us within the past week of indisposition. In each case he was a farmer who so complained. This seems a little unusual, for generally the farmer is about the healthiest member of society. In casting around for a cause of the sickness mentioned, we find that sanitary conditions are at fault. The common swill barrel and swill pail, which invite and create multitudes of microbes and bacteria, is one element of disease. Who has not seen these receptacles in hot weather with swarms of flies buzzing about them, and the air fairly reeking with the combined odors of decaying vegetation, sour milk and old dishwater, and yet their contents were unhesitatingly fed to hogs, expecting that thrift and growth would result. What was often actual consequence? A siege of hog cholera which the farmer usually attributed to "a streak of bad luck," but which could easily have been traced to the foul slop which the poor hogs were compelled to drink.

It is true, we do not have these nuisances in as great numbers as prevail in the East, but still the nuisance is present, and so long as it is in evidence so long will our chickens have bowel trouble and our hogs diarrhoea. Not only our animals, but members of the family as well.

It is a well-settled fact among physicians that flies carry bacteria, or germs on their feet, they feed from the swill barrel and the swill pail and carry away germs, hatched in the barrel or pail, to the house, where they drop them on what ever substance they alight. If taken into the stomach these germs produce bacteria, and these bacteria cause forms of sickness in the family.

Another fruitful source of disease in the family is the dirty cellar. If it has been the receptacle of vegetables during the winter and has not been thoroughly cleaned, and all decaying matter removed, it will throw off injurious gases and in time produce sickness. Decaying vegetables are unsanitary in any cellar and should be removed, the inclosure treated to a wash of sulphur and lime and the floor well cleaned. Children may, and often do contract throat trouble from the foul cellar. If the farmer expects health in his family he must enter on a campaign of cleanliness and put his premises in sanitary condition and consequent freedom from disease.

This campaign of sanitation can well be directed against many existing evils, might first be confined to an attack on the old-time "slop barrel" and the "swill pail," both unmitigated nuisances if not worse.

After these, then the purifying of the cellar, and the barnyard, cleaning the drinking fountains, of whatever source, thereby striking at the fruitful cause of many of the diseases which afflict the family and the stock during the summer months.

WALNUT LITIGATION.

The decision lately rendered by Judge Wellborn against the walnut growers, in the case of Anderson-Barngrover Co., vs. the Fullerton Walnut Growers Association for damages to the amount of \$23,000.00, is the result of a suit begun some four or five years ago.

Anderson-Barngrover Co. are the assignees of a patent obtained by Daniel Farrell for a method of bleaching walnuts by the use of a combination of chloride of lime and sal soda together with an acid which the patentee stated was preferably acetic acid as found in vinegar.

The Walnut Growers contended that since chloride of lime had been in use for bleaching, either alone or in combination with sal soda for at least one hundred years, and that all chemists knew that the addition of any acid would liberate the chlorine more rapidly and consequently cause more rapid bleaching, that there could be no valid patent on the process, moreover the application was rejected by the Patent Office, the application amended and again rejected until finally a patent

was allowed on the eighth application. It is likely there will be an appeal from the decision and as there are other suits pending it may be several years before a conclusion is arrived at.

In the meantime the associations have abandoned the Farrell process and all but one are using a chloride method which is said to be cheaper as well as more convenient.

KANSAS LEADS.

Kansas has been the originator of political reforms in the past and now she is to be the progenitor of a reform in school curriculum. If we are to credit the report which comes from the Norton High School, Kansas has the first agricultural course, in its second year of operation, which any high school in this country has adopted.

The school authorities did not merely say, "We will establish a course in agriculture in the high school," but they went about to establish it in an intelligent manner. The superintendent and principal discussed the matter with the farmers. They appealed to Secretary Wilson of the national department and he promised aid. The State Agricultural college sent a teacher from its expert classes to tour the county and arouse interest in the school's departure. Implement firms of the town agreed to instruct pupils in the best use of modern machinery. Prizes of over \$100 were offered for grain judging, which has become a regular feature of the school. Of the 700 boys in the last year, 10 took this course and the present year the class is larger.

Here is an object lesson for California school authorities to study with care.

THE GRANGE.

The organization of the "Grange" dates from 1867, at which time the first meeting for practical promotion work was held in Washington. From a very humble beginning this great farmers' society has grown to a most formidable proportion, numbering, it is estimated in membership, one-twenty-fourth of the farmers of the United States. The Grange, known by the name Patrons of Husbandry, and Pomonas, in various states, has for its object systematic co-operation among farmers and horticulturists. Women were admitted to full membership and their influence has been specially potent for good in the life of the organization. The Grange seeks to secure among farmers intimate social relations and acquaintance with each other, for the advancement and elevation of their pursuits, with an appreciation and protection of their true interests. By such means may be accomplished that which exists throughout the country in all other avocations, and among all other classes—combined, co-operative association for individual improvement and common benefit.

Among the advantages which may be derived from the order as we understand, are systematic arrangements for procuring and disseminating, in the most expeditious manner, information relative to crops, demand and supply, prices, markets and transportation throughout the country; also for the purchase and exchange of stock, seeds and desired varieties of plants and trees, and for the purpose of procuring help at home or from abroad, and situations for persons seeking employment; also for ascertaining and testing the merits of newly invented farming implements and those not in general use, and for detecting and exposing those who are unworthy and for protecting, by all available means, the farming interests from fraud and deception and combinations of every kind.

In California the Grange is not so potent a factor in general as it might be, were its purposes better known and understood, but it is gaining ground steadily and will become more useful and influential as its merits appeal to individual farmers of the State. Live men like John Tuohy of Tulare, are doing much to advance the order in the estimation of the public.

Kansas now has more than 711,000 milk cows whose annual product amounts to more than \$17,000,000, and equals the sum total of all agricultural and horticultural products of the State with the single exceptions of corn and wheat.—Kansas Farmer.

News of Country Life in the Golden West

Southern California

Northern California

AGRICULTURE.

Alamitos sugar factory is now in full operation.

Riverside county claims to have a 1,000,000 hay crop this season.

Riverside has a new ordinance compelling the cleaning up of weeds.

Chiles growing about Anaheim are said to show up exceptionally good.

Thirty hogs went up as a result of field fire near Riverside last week.

Moreno and Alessandro valleys have about 10,000 acres of hay and grain this year.

Thermal claims to ripen Bermuda onions a full month ahead of the early Texas season.

Grow alfalfa and you will wear diamonds, is the claim of many papers in alfalfa sections.

Yucaipa valley and Banning have harvesters in full swing in their extensive grain fields.

A new machine for topping and pulling sugar beets is being tested at Alamitos sugar factory.

The demand for hunters tags has been so keen that the supply has been exhausted in many counties.

Horticultural Commissioners of Orange county are after owners of vacant lots for leaving them untidy.

Southern California is now relieved from its nine days heat and is having most livable and enjoyable weather.

The department at Washington has published a pamphlet descriptive of the pumping plants about the city of Pomona.

The Whittier, East Whittier and La Habra Vegetable Association claims the acreage of tomatoes near Whittier at 600. Good crop is promised.

Fifty thousand home seekers is claimed to be the total of the easterners arriving in California looking for permanent locations this past season.

El Centro, Imperial valley, has corn eleven feet high with young roasting ears each fourteen inches in length, which was planted the first week in April.

Crestmore, near Colton, has struck a fine flow of water at a depth of 500 feet. It is claimed that over 150 miners' inches is being given from one well.

Residents of Water Co. No 8 of Imperial valley have combined to protect their homes, which have largely been left vacant during the hot weather, from marauders.

The ending of the grain and cantaloupe season in the Imperial valley at practically the same time has caused an exodus which has greatly reduced the midsummer population of that section.

Indio, in the Colorado desert, has been looking at the prosperity of other communities to the east until now it is waking up and claims to be something of an agriculture center of its own.

H. W. Myers of Tropico planted this spring some tubers from the Ohio Early Rose. He has harvested one of the best specimens of this delicious potato we have ever eaten. The potato is well formed, a rich rose color and mealy. For a sandy soil it is admirable, surpassing even the Burbank in richness.

HORTICULTURE.

Corona has a total shipment of 1624 cars of citrus fruits.

The last car of oranges has been forwarded from Highlands.

Santa Ana gives a Mexican ten days in jail for swiping oranges.

Highlands reports a heavy setting of oranges for the coming crop.

The Osmun ranch at Whittier has just installed a \$4000 pumping plant.

This is a banner year for navel oranges is the claim of most fruit growers.

Five acres of apricots belonging to W. F. Whittier at Hemet brought \$1868.

The shortest apricot season in the history of the industry is claimed for this year.

Orange county has opened up a section to small fruit ranches at Newport mesa.

Peaches are in market at Hemet now, and the ranchers are being offered \$30 per ton.

The outlook for apples in Oak Glen indicates that the crop will be much short of last year.

Mr. Leffingwell owner of the large lemon ranch at Whittier spends his summer vacation in Japan.

Anaheim has a large acreage devoted to tomato culture which will be delivered in quantities to the cannery.

While too early to form opinion of the coming orange crop, Redland papers claim "June drop" is very light.

Redlands claims the record for prices of Valencias, one car of that fruit bringing \$1536 net to the packers.

R. & G. Dunn show the prices for apricots over the State of California is the greatest in the history of the industry.

A temporary failure of the ice factory in the Imperial valley almost resulted in great loss to melon shippers during the hot spell.

The cantaloupe crop of Imperial and Coachella valleys was quite badly reduced owing to the extreme hot weather coming near the end of the season.

Orange growers of Southern California are still rebelling at the method of distribution of cars by the Southern Pacific and Santa Fe railroad companies.

The interest of all dried fruit men is very keen over the destruction of the industry, thought by some to be the result of Secretary Wilson's construction of the Pure Food law.

The Anaheim Gazette claims that the navel orange has advanced Southern California twenty years and that if God could have made a better orange than the navel He never did.

Anaheim Water Company and Santa Ana irrigation Company have brought suit in San Bernarilino county to enjoin Riverside irrigators from illegal delivery of water from the Santa Ana river.

The hot weather combined with the ending of the harvest and cantaloupe crops at Imperial caused great concern to the friends of the new Imperial county, for fear the loss of voters may endanger the success of the vote.

AGRICULTURE.

Santa Ana poultry men have decided to hold a poultry show this fall.

Corcoran will harvest over a thousand acres of sugar beets this season.

Fresno claims that alfalfa hay will go to higher price than ever before this fall.

Petaluma has a stalk of corn planted on May 5th now measuring eight feet in height.

Tulare Lake now boasts of a gasoline launch to carry passengers from ranch to ranch.

Turlock claims that its creamery is realizing better prices than most others in the state.

Three dollars per sack is what the river potato growers are receiving for their crop this year.

Hanford is claimed to be the home of some magnificent horses which are now being bred in that section.

Foundation is being built for the new sugar factory at Corcoran, and the order has been placed for the machinery.

A field fire destroyed several buildings and large quantities of standing barley near Woodland, Yolo county, last week.

The Kaweah river is reported much higher than for several years at this date and is giving a longer irrigating season in consequence.

Contracts are already signed for 4000 acres of sugar beets in the Corcoran country to be delivered at the new sugar factory next season.

The State Polytechnic School at San Luis Obispo, was threatened with destruction in the field fire last week, but was finally saved.

The Pacific Sugar Company's plant at Visalia is being quite extensively improved this season, over \$75,000 being added to its equipment.

Mendocino county claims its sheep are in exceedingly fine condition for mutton; \$4 to \$4.50 a head for the good wethers are favorite figures.

The output of grain in Modesto section is estimated to be about one-half the crop of the east side of San Joaquin and something less than one-half an average on the west side.

The Fresno Republican says that the exaction of Japanese labor is causing the ranchers to look to Mexico for peons to perform the lower grades of ranch labor in that section.

L. C. Byce, head of the Petaluma Incubator Co., with his manager H. C. Gray, have returned from an extended trip over the East, where supplies were laid in for a larger output of Petaluma Incubators than ever before.

The break of the levee near Bakersfield, caused the flooding of the section of rich farm land two to twelve miles wide and thirty-five miles long. It is claimed that it will be years before the marks of this catastrophe will have disappeared.

The United States court at Los Angeles, Wellborn, judge, has decided that the long contested suit of Anderson-Barngrover of San Jose against Fullerton Walnut Association in favor of the plaintiff. The court has fixed damages against the Fullerton growers at \$32,000. The case will be appealed.

HORTICULTURE.

Kerman is selling peaches at \$70 per ton.

A new irrigating canal is to be constructed near Hanford.

Early grapes of San Joaquin county are bringing \$60 to \$70 per ton.

Pears are being shipped from Lake county and are bringing \$50 a ton.

Turlock is shipping cantaloupes, of which it claims to have a fine output this year.

An immense crop of grapes is promised for the whole San Joaquin county section.

The farmers of San Joaquin valley are planning for the construction of a deep water way.

Hanford Sentinel says that almost its entire output of 'cots will be forwarded direct to Germany.

Fierce fires are burning in the Sierras back of Bakersfield, causing great loss on the water sheds.

The next annual State Fruit Growers' Convention will be held at Marysville, December 3rd to 6th.

Five thousand acres in one vineyard are to be planted near Kerman, Fresno county, which will be the largest single planting of wine grapes in the State.

County Health Officers of Fresno, maintain that ranchers who fight grasshoppers with poison in their vineyards are violating the law and must cease.

It is now claimed that the output of prunes in California this year will not exceed 36,000,000 pounds. This will only be about one-third of last year's output.

The State Board of Trade at San Francisco is making a strong fight to prove that the sulphuring of fruit in the process of drying is not injurious to that fruit as a food.

Prunes in Oregon having practically all been purchased by advance contracts at a three and one-fourth cent basis, it is felt that California prunes have good promise of big returns.

The Visalia cannery, a branch of the California Fruit Cannery Association, is working on peaches. The cannery has been improved by the addition of considerable new machinery.

Some Marysville people regretted so much to see their fine trees of many years give away in order to destroy the White Fly, that they have made some trouble for the commissioners of that county, who are endeavoring to secure a thorough clean up of the White Fly pest.

N. G. Perry, one of the Cultivator subscribers at Loomis, while in the office last week told us Placer county will have more than half the usual crop this season for which good returns will be received by the grower. There is no White Fly in that locality nearer than Marysville.

The highest price this year was received in New York for a carload of San Jose cherries which commanded \$4500. This is claimed to be the banner price for any carload of green fruit ever sent to any State of the Union from any market in any country. In fact, San Jose swells up and says that it is the banner car of the world.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultry-men are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

SET RULES OR METHODS.

MANY letters are received by us from beginners asking for a safe rule to follow in the care and feed of chicks, and while we have followed our own methods and plans we have always felt that many others had just as good (and perhaps better) ways of feeding and caring for young chicks. In order to give the readers of the Cultivator the benefit of experience poultrymen in different parts of the State we sent to a number of breeders, questions requesting answers of not over 500 words, and have received some excellent articles from breeders and fanciers, known as such not only in California, but the entire Pacific Coast.

We trust that as these articles appear others will grow enthusiastic and send us their methods of feeding.

The first article is from the well known and successful White Leghorn specialist Mr. Frank E. Baldwin of San Jose. The only change we would make in his method of feeding would be when he feeds whole wheat we would add cracked corn in small quantity. In Mr. Baldwin's letter accompanying his article he says: "So far as he knows his plan in teaching his chicks to roost is original with him, and works like a charm with Leghorns. He also says that he never puts a chick on the roost—we put the roost in the right place and they do the rest." We never saw more crowded into one sentence than is contained in the above. It certainly gives much food for thought. If more poultrymen would study the conditions and habits of our birds we would find many ways where they would help themselves and benefit us.

Mr. Baldwin's Way.

When chicks are taken from incubators they are fed fine grit and water for first full day. The grit is put on their boards to raise it above the litter so the little chicks can find it. The second day and for a week we feed one of the prepared dry, small grain or seed mixtures, five or six times a day on the thin boards so chicks can find it under their feet. The second week we add cracked wheat gradually increasing the cracked wheat till about the fourth week, when we add whole wheat, as well as cracked, and increase the whole wheat till at six week's old they eat all whole wheat. After the first week the feed is thrown in litter where they scratch for it.

We give them water in a galvanized iron drinking fountain and skimmed milk in a pint earthenware font from the start.

On the fifth day we give them meat scraps in dishes shallow enough so they can find it easily and the second week and after, they get meat scraps from a hopper.

We give them green stuff, lettuce, cut grass or anything green, in fact, all the time they are in the brooder. Good Scheme for Green Feed.

At three week's old the chicks are running in the brooder yards with water dripping from faucets into clean pans. Each yard has hopper of grit—charcoal and meat scraps as well as a bed of alfalfa growing under an

inch mesh wire held up from the ground by six-inch boards. The chick eat it down to the wire and keep eating it as it grows.

A Mash.

At three weeks old we feed mash once a day in the yards. We use some mash as fed to mature stock, to save labor. The mash is of bran, ground barley, middlings, corn meal, bee scraps, charcoal, oil cake meal and alfalfa dry leaves or ground alfalfa.

I have twelve individual outdoor brooders, Charles A. Cypher's Model and put fifty chicks in each.

How Many to a Brood.

I have constructed three roosts of laths, one a little higher than the front of the hover and a little toward the front of the brooder. The next roost a little higher and in the middle of the nursery chamber, while the last is higher still and near the front of the brooder. At a week or ten days they will find the top of hover and in the next week will begin to climb onto these roosts. At three weeks the roosts are covered every night with roosting chicks. At six weeks they are shut down stairs under the brooders and go to roost there without bunching while another lot from incubator are put in brooders above.

Yours for better poultry and less work.—Frank E. Baldwin, San Jose, Cal.

* * *

Now, From the 'Dobe Incubator Woman'

The following from Mrs. C. D. Hubbard of San Fernando, breeders of White Wyandottes is to the point. Many readers of the Cultivator will remember Mrs. Hubbard, as the originator of the Adobe incubator with a capacity of three thousand eggs also the Adobe brooder which is three hundred and sixty feet long, both are successfully operated at Mission View Poultry Ranch.

Mrs. Hubbard's Way.

I take the chicks from the nest of incubator when they are from 30 to 36 hours old, put them in the brooder with the temperature at about 85 degrees for the first 24 hours then no over 80 degrees for about one week. One should watch and see that they do not crowd if they do then they are cold; also watch that they do not get overheated. As a chick grows it needs less heat. Remember that a chick that has been chilled or overheated seldom lives and if it does it will not pay you for its feed. I feed them entirely on chick feed until they are ten days old. Feed them green feed also, twice a day, chick feed three times a day, fresh water twice a day. At ten days I begin to feed in the morning a mash consisting of bran, cracked corn, or Egyptian corn, prefer the latter, meat, bone, blood shell and charcoal two pounds of bran, two pounds of corn, four ounces meat, four ounces blood, four ounces bone, four ounces shell and two ounces charcoal. Chick feed balance of the day. When six weeks old I feed them the same as hens.

Size of Colony.

When first hatched I keep fifty to a brood at five days, 40 at ten days 30 until they are ready for cold brooder. This number is for hot brooder with floor space under hovers 18x36 inches and indoor run 3x9 1-2 feet and outdoor run 3x20 feet.—Mrs. C. D. Hubbard, San Fernando.

and many that are practical. We feel sure that this will be read with interest and will prove a benefit to many.

Mr. Hayden's Letter.

In answer to your questions, will say I have found feed meal, fed dry, highly satisfactory for the first week or ten days. As they mature, I add to this cracked wheat and cracked corn, abandoning the finer meal, when the baby days are past. Until that time I keep the meal always in sight, but when it is given up I hide their grain in straw and make them work for it as do the older fowls. Four things to eat can be kept before young chicks from the first day, (coop them all so Mother Biddy will not kick them skyward) grit, charcoal, bone and meat. Get these fine enough and the animal food as fresh as possible. Every chick on my place has access to fresh, dripping water. If your vessel under the hydrant is deep, fill it with rock and the chicks will not drown. Keep these water reservoirs clean, klean, clyen! Never rub them with hands. Keep gunnysack rags in wire fence near by. But, better far, fetch down from the house a pail of boiling water and let these disease accumulating reservoirs get an unfashionable soak, say once a week. Then rub thoroughly and rub and wash and rinse again.

Perhaps now Mr. Roup will pass your door; he calls only on fashionable folk at Filthville.

No Greens for Little Ones.

Baby chicks will not eat greens, even lettuce offers no temptation the first few days. In two weeks, however, begin with it and if Biddy is in charge you will soon find she will take it all unless you hide it beyond her reach, as I suggest doing with the four auxiliary staples. This leads me to add, Biddy will cover and protect her babies very much better if you will give the half-starved lady several good, square kitchen meals soon after she leaves her nest. To do this confine her for five minutes away from the brood where she cannot hear them. She will return to their protection with a warmer body and far more disposed to squat and brood, which is precisely what they need.

Their food you have provided. Here further usefulness is to be an ever ready shelter from the cold. Let her eat also the grain the chicks eat. If you feed her heavy wheat the chicks will get it too.

Colonies.

Regarding "colonies," would say: when my hens refuse to cover their young I separate them but do not join these to a similar brood until or unless I need the room.

A little more work to care for them? Yes, but they will do better if kept in small numbers. My broods are always large because I always set two hens the same night and give the chicks to one hen unless the hatch runs over sixteen. One can set three hens similarly and give the chicks to two mothers.

After confinement alone with their mother for five days so they will learn to distinguish her, it is a good plan during the colder months to put two mothers together with their broods. If they become resigned and quit scrapping you will save labor, of course, but mainly, one may refuse to cover her young altogether too early, in which case the foster mother may save several young lives. Almost invariably the chicks will drift toward the superior matron which also gives you the deserted hen for

Molting Time

is the time to provide for eggs when they will be scarce and high. Don't let your hens molt for months. Don't let them get completely run down and all out of condition. This they will certainly do unless you use care and intelligence in feeding them through this trying season.

West Coast Egg Food

is a highly nitrogenous Poultry Food, rich in protein, composed of the finest grains, seeds, roots, salt, iron, charcoal, condiments, shells, oil cake, bone, meat and dried blood to keep the poultry in good health, build up a strong and vigorous system, make the hen molt early and convert the surplus aliment into eggs. It is a full, scientifically balanced ration containing no filler but every ounce is pure food. Many so-called "Poultry Foods" and "Egg Makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. But it is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it does not make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that a hen has no use for the shell until she has made the egg.

West Coast Egg Food

is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve the purpose of assisting the hen in her molting and then in producing eggs, and at the same time to build up her system and keep her in the best of health. The hens like it, they eat it, there is no waste, hence it is the cheapest Egg Food on the market.

West Coast Egg Food

can be fed either as a mash or as dry feed, though we recommend the latter because it is more natural and, we think, the better way. Don't ask Biddy to fill the egg basket without giving her good care and providing her with proper material for the purpose. Feed her West Coast Egg Food. For sale by many dealers. If yours doesn't keep it, or will not get it for you, send direct to us.

your breeding pens many days before otherwise you could spare her. Regarding the perch or roost, I never encourage it too early. In fact, it is better to place it high so they will have to use their wings to secure it.—N. Hayden, Altadena.

AROUND THE YARDS.

Don't wait until the rainy season starts before you build your house.

Be kind to the broody hen; remember nature demands a rest, and setting is a rest for them.

The reason many flocks don't pay, is because they are neglected. Are yours paying?

Pullets and hens should not be fed in the same yard, as they require different kinds and amounts of feed.

Gather your eggs often this warm weather and get them to market while they are fresh.

Breeding standard bred fowls is an interesting work aside from the financial profit to be derived from it. There is considerable pleasure in handling and producing the beautiful specimens of fowl life.

By using a little care in selecting your hens you can increase the size of eggs. Keep those that come near-

est laying the kind of eggs you want for next years breeders.

It is hard to pick a prolific layer by points. The amount of production tells the story.

Well, What Do You Think of This?

Wouldn't you Californians like to live "Back East" where you can get cheap hen food? Listen to this from an Eastern Exchange:

"A New York man, William A. Woodbury, has at last found a use for the mosquito, the bane of all the suburbs of the metropolis, and he declares that the much-maligned insect should be cultivated instead of eradicated.

"The gentleman in question has a summer home on Long Island where the little pests—or blessings—abound in great numbers. One night he set up a net with a large opening and a brilliant light at the small end. In the morning the net was full of mosquitoes and other insects.

"These he fed to the hens, and according to voracious chroniclers, the fowls thrived wonderfully on the food and proceeded to lay eggs at a furious rate in order to show their appreciation.

"Mr. Woodbury estimates that he has caught about a ton of mosquitoes for his hens and ducks since summer began, and he advises all farmers to go in for his cheap brand of hen food.

"This information comes from a metropolitan paper and is respectfully referred to the experts of the Department of Agriculture as a suitable topic for another bulletin."

Bees and Their Care

HONEY PRODUCTION.

ANY one acquainted with bees knows there is no certainty what the honey harvest may be until it is actually secured or, in many cases, until the sections are filled and removed from the hive, for it frequently happens that the flow is good during a part of the season and then for some reason it suddenly ceases, leaving the sections unsealed. Such instances frequently occur, says a writer in Coleman's Rural. It is by no means an easy task to obtain really well finished sections, though if the sections are properly prepared and placed upon strong colonies or swarms standing near fields of white or alsike clover, or similarly good honey-producing crops, the bulk of the sections will generally be well finished.

The great secret of obtaining well finished sections is to crowd the bees. This is done in two ways, either by removing the outer frames from the strong colony and substituting dummies at the commencement of the honey flow, or by giving a very strong swarm limited room in the brood chamber when hived. By adopting the former method the crowding has a tendency to cause swarming, but so long as fine weather continues and the bees have ample but not too much super room, so long will swarming, as a rule, be avoided. It is when there comes a change in the weather, compelling the bees to leave the super and further crowd in the brood chamber, that swarming is practically certain, unless during the time they are so crowded, work in the form of comb building is given by substituting empty for full frames in the brood chamber.

To succeed in the production and sale of sections requires much more skill and patience than many beekeepers are in a position to give. We have found that it is very hard to get the beginner to see the importance of keeping the full working force of the colony together during the entire honey flow. They nearly all seem to think that the more colonies of bees they have the more honey they will get, and it is very hard to make them understand why it is that a good strong colony of workers will gather a surplus of fifty pounds of honey when, if they had been divided and two colonies made of them, they would probably have not given their owner any surplus honey at all. We are becoming more and more convinced of the value of drawn combs. Supers containing sections with full sheets of foundation do very well, but it is plainly evident that those supers containing drawn combs are entered more quickly and filled with honey. Until very recently the most difficult and not the least dangerous of operations in the apiary, was the removal of supers, but with accurately fitting parts, and the avoidance of all incentive to the building of brace combs, the difficulty is removed, while by the use of bee escapes the bees leave the supers without disturbance. There are two or three advantages in putting on bee escapes. First, you get rid of the greater part of the bees. Then, if there are any brace combs between the super and the brood department, these are all broken and the honey there may be quietly and without danger of robbing. There is also a great advantage in not disturbing the colony, since all, or nearly all, the bees have left the super of their own accord.

A PLEA FOR MORE HONEY.

Any one who doubts that there is money in bee-keeping need only to look up statistics on the honey crop of the United States to find out what a great marketable article honey is. In the year 1900 the total amount of capital invested in bees in the United States was \$10,186,000. The returns from the national honey crop that same year were \$6,665,000. A dividend of 65 per cent on the amount invested. What other crop pays this rate of interest?

At a convention of the bee-keepers of the State of Massachusetts held this year, the fact was revealed that only forty tons of honey were raised annually in the State, while the amount of honey consumed each twelve months amounts to more than 200 tons.

Honey is always a ready seller, and the price per pound averages anywhere from 12 to 20 cents, depending upon the locality and quality. A good hive of bees in the average locality will produce about 75 pounds of honey per year and pay 50 per cent on the investment the first season. Get posted in bee-keeping, if you seek a pleasant and profitable occupation.—Exchange.

HUNTERS, GET A LICENSE.

Cultivator readers must not ignore the new hunter's license law now in force. Any resident of the State and a citizen of the United States may secure one by paying \$1; a non-resident of California, but a citizen of the United States may, upon the payment of \$10, while any person not a citizen of this country must pay \$25.

See your County Clerk for the license and don't try to evade the law.

For the convenience of those residing at a distance from the county seat, and to save them time and expense, the Commission has had prepared Hunter's Application blanks, which may be obtained by addressing request for the same to the County Clerk of your county, or to the fish commission, at San Francisco. On receipt of the application properly filled out, enclosing money order, the Hunter's License will be promptly forwarded to the desired address.

MANY USEFUL HINTS.

J. Steckmeyer, of El Verano, Sonoma Co., writes "I wish to mention that the California Cultivator is a very useful paper. My wife and I both find many useful hints in it."

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow Street, Los Angeles.

HOW DID SHE KNOW?

The local Woman's Club had offered a prize for the best essay, by any member, on "How to Make a Husband Happy."

It was a cash prize, and summer expenses were in the near distance and the competition was large and warm.

The winning paper was just three words long, and, stranger even than that, it was submitted by a spinster of fifty-seven. Her dictum was merely this: "Feed the brute."—Lippincott's.

A. C. W. Pearl Oyster Shell

Beef Meal, Beef Scraps, Bone (all grades of fineness) and all A. C. W. raw materials are for sale at dealers or direct from our factory, should you desire to mix your own egg food. You may have noticed a difference in A. C. W. raw material from others. If not, buy some and see for yourself. Note the clean, bright appearance and absence of foreign or waste matter.

GOD BLESS MOTHER.

A little child with flaxen hair,
And sunlit eyes so sweet and fair,
Who kneels, when twilight darkens
all,
And from those loving lips there
fall
The accents of this simple prayer:
"God bless!—God bless my mother!"

A youth upon life's threshold wide,
Who leaves a gentle mother's side,
Yet keeps, enshrined within his
breast,
Her words of warning—still the
best;
And whispers, when temptation-
tried:
"God bless!—God bless my mother!"

A white-haired man who gazes back
Along life's weary, furrowed track,
And sees one face—an angel's now!
Hears words of light that led aright,
And prays with reverential brow:
"God bless!—God bless my mother!"
—Brooklyn Magazine.

HIRAM'S LUCKY AUCTION.

WITH a whoop the Caldwell children rushed out to greet their father, and Mrs. Caldwell hurried after them to head off any raids on the green bob sled.

"Get everything, father?" she called, as she peered out of the storm door.

"Got a plenty," he called back, with an attempt at heartiness that caused her to glance quickly at the sled. She had heard those half apologetic tones before and knew what they meant.

Back in the sled, covered by a blanket was a square package. It was not the right shape package. It was nor tall enough for a barrel.

She drove the children into the house and shrouding her head in an old wood fascinator she followed out to the barn, where Hiram was already unhitching the tired team.

She made straight for the sled and threw aside the blanket, discovering a small soda fountain.

"What did you pay for this," she demanded, indicating the square of stained marble with its tarnished spigots.

"Six dollars and thirty cents," he said, the red surging into his face. "The man said the metal is worth more'n that."

"Then you didn't have anything left for the presents?" she asked, reproachfully. "Oh, Hiram! And after you promised."

"But, look here," he argued. "There is bound to be another store set up. Maybe they'll want a fountain and I can sell this at a big profit."

There was no use in arguing. Ever since they had been married she had tried to persuade Hiram to stop buying things at auction, but it was a passion with him, as it had been with his father before him.

He had never before made quite so ridiculous a purchase as a soda fountain, but he never acquired anything worth while. He bought cheap for the love of buying, things so old or useless that no one else would bid.

Were it not for the little shop Mrs. Caldwell kept in the front room for the benefit of the neighbors, the mortgage would have been foreclosed years ago. As it was, she kept up the interest with the meager profits of the little store and the egg and butter money.

This and some of the grocery money had gone into this ugly, useless fountain. In the fascination for the sale all else was forgotten.

The next morning Hiram hailed a passing acquaintance and together they stalled the fountain behind the

tiny counter that had once been part of McQuiston's store before the sheriff had seized the goods.

It was several weeks before Mrs. Caldwell was satisfied, but at last she had to admit that the gleaming marble with its polished spigots, gave "tone" to the place.

When the days grew warm the ice box was filled and lemon soda and homemade birch and ginger beer were dispensed to the youngsters of the neighborhood.

Then came a day when one of the big red automobiles that went flashing down the road on the way to the falls, stopped in front of the yard. A leathern clad man tramped up the gravel walk and returned to the car with three glasses of birch beer.

When he came back with the empty glasses he drained two more himself and threw down a quarter.

"You ought to have a bigger sign," he said, as he sat down his glass. "I barely made out the place myself."

"I guess I will," said Mira, as she laid down fifteen cents.

"That's worth five cents a glass," he said. "You'll never make money at two cents a glass. You'd better raise your price and begin with me."

He pushed the money back to her, and with a courteous doffing of his cap was off.

Mira was slow of thought but quick of action. When the auto sped down the road on its way back to the city, a huge sign decorated the fence. Mira had sacrificed one of her scanty store of sheets, but already she had sold twenty glasses of soda at a net profit of eighty cents.

Her visitor of the morning drew up again.

"My sister enjoyed the soda so much that we want more," he said, with a smile. "I see you have the sign out."

"Made it with store blacking," said Mira proudly. "I didn't have any paint."

"It does first-rate," he declared. "Had any results?"

"This makes a dollar sixty," said Mira. "That's more than I take in usually in a week."

"Advertising is the secret of success," he pronounced. "Keep it up and you'll be needing some assistance soon."

It was several days before that particular auto stopped in front of the weather-beaten gate. This time the driver was alone. He drank a glass of ginger ale and asked for a sandwich.

This was a new demand, but there was part of a chicken left from Sunday, and presently Gertrude came in with a dainty sandwich that brought fresh praise from the visitor.

"You'll have to make a new sign," he said, as he set down the empty plate. "With homemade bread, fresh butter and chicken that never heard of a beef trust, you've an article that can't be beaten. Look here," he added, "why don't you start a real inn? There are hundreds of autos in town. The road to the falls is the best hereabout, and there's no chance to buy decent food. Put some tables out under the trees. Put in a stock of syrups and a tank of soda. Add some ice cream and cake—and keep everything just as home-like as you can."

Gertrude clapped her hands. "We'll do it, mother," she cried. "Can't you see what he means? Thank you so much for your suggestion."

"Look here," he said. "That old

stump by the gate is no use, is it?"

"We're going to have it pulled when Hiram gets the time," said Mira, apologetically. "We've been meaning to do it ever since the lightning struck it."

"Don't do it," her patron almost shouted. "I've got a bully idea. Let me be the godfather of the place and I'll make a sign out of the tree for a christening present."

He was back again early the next morning. He smiled appreciatively as he saw half a dozen small tables scattered about under the trees. The grass had been mowed and the place looked fresh and inviting.

Under his direction a man he had brought with him began to hack at the tree.

An auto party came up just then and took possession of one of the tables. Gertrude went off to wait on them, and by the time they had taken their departure the wood carver had completed his task.

The old stump, denuded of its bark, stood splintered and torn, but with a smooth oval on its face.

"That doesn't seem to be anything," said Gertrude, as she regarded his work.

"It will be a work of art before I get through with it," he explained, "or my name isn't Ernest Paynter."

"It is? Are you really Mr. Paynter, the artist?" she asked, finding that fact of greater interest than the sign.

"Bless my heart," he exclaimed, "I seemed to know you all so well that I forgot you did not know my name. I am Ernest Paynter and very much at your service."

She extended her hand with a formal little "Glad to meet you. Mr. Paynter." that made them both laugh, and, still holding her hand, he drew her into the road where she could see the front of the sign. On the panel, in raised letters, were the words, "Good Luck Inn."

"That's the name of the place," he explained.

The sign seemed all that was needed, for trade grew to proportions undreamed of. A soda manufacturer sent a wagon out once a week with a load of tanks for the fountain. Hiram scoured the country for poultry and eggs, and instead of the long drive to the creamery each night it was not long before they bought cows to supply their own increased needs.

Paynter was out almost every day, and it was he who kept the price at a point that sometimes worried honest Mira Caldwell's conscience. A dollar for a meal seemed reasonable, but Ernest held out for \$2 a head, and very soon they had to establish a waiting list.

By the time the motoring season closed and there were only occasional calls for hot coffee and sandwiches, Mrs. Caldwell was glad of the rest.

Long before most of the hard work had been delegated to hired girls, and she had contented herself with running the kitchen, in which a new range had been established, but these had been busy times for all, and even now there was enough to keep Gertrude busy, so there was a new teacher at Mink's Crossing.

"We don't have to worry about the mortgage," laughed Gertrude. "That's paid off, and there's plenty in the bank."

"And to think you pa claims that the fountain was a mascot," said Mira. "That Ernest Paynter was the real mascot."

"He was wonderfully good," said Gertrude, softly, as she moved the ladder over to the chandelier.

BROCK & FEAGANS

Broadway & 4th St. Jewelers Los Angeles

"That's what he was," was the emphatic response. "Gertrude, when you get married, I want you to marry a man like Ernest Paynter."

"Yes, ma'am," Gertrude answered dutifully.

"I made my mistake when I married Hiram," ran on Mira. "I want to see you married right. Why, I remember—"

Her reminiscence was cut short by a cry from Gertrude. Ernest entering the room had caught her on the ladder and was holding her securely in his arms.

"I didn't mean to eavesdrop," he said, laughing, as he faced Mrs. Caldwell, his arms still about the girl. "But since you and I are agreed as to the man she ought to marry, suppose we hear what Gertrude has to say?"

Mira didn't hear Gertrude's reply, but, as she surveyed her tear-stained face, she needed no verbal assurance.—*Brooklyn Times.*

SAVING THE BLACKBERRY CROP.

The scarcity of some fruits which are usually very plentiful should be a spur to a careful gathering and preserving of the crop of such as produce a fair yield. Strawberries in spite of the early unfavorable reports have redeemed themselves as usual, and have again proved that this little plant can be depended on "to do something" when more pretentious fruits fail.

The blackberry, too, will yield an abundant harvest of luscious fruit if the profusion of bloom may be taken as an indication.

It would be the part of wisdom to make the best use possible of these berries and secure plenty of cans, etc., if they are not already on hand, so that an abundance may be saved for a year's supply at least. If more are canned and preserved etc., than will be used till the fruit season comes again no harm will be done; for though "enough is as good as a feast," it is best to be on the safe side and have plenty, for "enough" is often a variable quantity determined by existing conditions.

In this connection the writer is reminded of a fragment of conversation heard years ago between two housewives on this very subject of canning berries. Said Mrs. A: "I have canned all the blackberries I intend to this year; I have twenty quarts; I reckon that will be enough." "Yes, maybe that's enough," admitted Mrs. B., "but I have canned twenty gallons, for I want a plenty."

That is the point to have in mind the present year. Be sure to save "a plenty" of such fruit and vegetables as there may be a surplus of for there is certain to be a scarcity of many kinds, and a good store house to draw from, for food supplies saves grocer's bills.

Raspberry Shrub.

Raspberry shrub possesses the advantage of being easily made. Put them in a large stone jar, or huge yellow bowl, and pour over them enough pure cider vinegar to reach as far as the berries, but no more. If the vinegar is too acid, a little less will suffice. Let the berries soak in the vinegar for thirty-six hours. Lay a coarse muslin strainer in a colander, over a stone jar, and dip the vinegar and raspberries into it, mashing the berries to extract all their juice. Measure the liquid and put it over the fire in a porcelain-lined or aluminum kettle. When it boils, add a pound of loaf sugar for every pint,

and let the whole boil for ten minutes; then bottle and seal. Use about two tablespoons of the syrup in a glass of water. Add about two tablespoons of crushed ice, stir it, and serve it with the most delicate white sponge cake or with the simple wafers.

Raspberry Cordial.

Mash in a stone jar four quarts of ripe berries, with a pound of white sugar, and pour over them one quart of fine cider vinegar. Set the jar in the hot sunshine four hours; then strain the mixture, pressing out all the juice. Bottle and seal, and lay the bottles on their sides in a cool cellar. Drink in the proportion of two tablespoons to a tumbler of ice water.

Potato Puffs.

Mould warm mashed potatoes in balls about the size of an English walnut. Place in a buttered tin brush with a well-beaten egg and set in the oven to brown. Serve hot Garnish with greens.

One-Egg Cake.

One tablespoon of butter, one egg cream them. One cup of sugar, one cup of milk, one and a half cups of flour, with two teaspoons of baking powder. Flavor to taste.

IN THE INTEREST OF CHILDREN

Oil of pine needles will often furnish relief when a child has croup or bronchial tightening, and has difficulty in breathing. Put one teaspoonful of the oil into a small basin of water and set it on an alcohol stove or gas burner in the room where the child sleeps. The fumes soon make the child more comfortable, and sometimes cause him to fall asleep. This is only a relief and not a cure, and should not be considered as a substitute for calling a physician in severe cases.

CAUTION: If a gas burner is used for heating the mixture, light the gas first before setting the pan on the burner. Sometimes the light comes on suddenly, with a sort of puff, in which case the oil in the pan may catch fire and quite a blaze will follow.

* * *

One woman writes that when her baby was small she bathed him in the enamel washstand in the bathroom, the bowl of which was unusually large. As the bathroom was not large, a wide board shelf was made, with cleats beneath to keep it from sliding, and set on the bathtub. Upon this were placed the baby's clothes and basket. In this way the things were within reach and the bath was easily and conveniently accomplished. The shelf could be lifted off and placed behind the tub when not in use.

* * *

The same clever woman has discovered that a strip of molding at the top of the tiled wainscoting is of great convenience. Loops of cord are attached to the molding to which tie clasps or supporter snaps are fastened. When towels or baby's articles, which have been washed and need to be hung up to dry, they are simply attached to these clasps at the corners and are held securely.

To keep the children's toys, a large wooden box is a great convenience. The lid should be supplied with hinges and a handle, and the box should be about 12x30 inches and 1 inches high. Paint the box black and paste on the top and sides some of the charming children's pictures which may be cut from the magazines. Put a coat of varnish over all and the pictures will not pull off and the box may be washed.

Queries and Replies Legal Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

'Dobe Incubator.

A subscriber wishes information as to plans of constructing a 'dobe incubator. We do not think any plans for these can be secured from anyone who makes it a business to produce them. Mrs. Hubbard at San Fernando, has the only successful one we know of and no doubt she would give information to one who should call and examine it.

Diabrotica.

My garden, especially the pumpkin, squash and beans, are badly infested with small bugs. They are smaller than the house fly. Some are yellow with black spot and others yellow with black stripes. What can I do to destroy them? Please answer through Cultivator at earliest opportunity.—C. M. J., Carning.

From your description we presume these are Diabrotica, of which there are two varieties, formerly described in the Cultivator. Paris green spray helps a little, but they are exasperating and hard to control.

Three-Horse Evener.

Please give plan for a three-horse evener, for cultivator with tongue, which will not have side draft.—M. C. S., Rialto.

This is an exceedingly hard proposition and as one practical farmer who has had much experience told us that a plan which we suggested would not do it and that to be without any side draft at all is an impossibility. However, we will ask subscribers to send suggestions which will be of value to our Rialto correspondent.

Budding Walnuts.

Will you please inform me what time of the year should walnut scions be cut and when inserted? Would placing buds in August do, same as budding oranges? When do you bud apricots? Can you tell me where pure rubber can be purchased, that will dissolve in Chloroform? I am trying to work over some old walnut trees.—W. W., Santa Ana.

Walnut scions should be cut only when the trees are dormant and preferably in January. These should then be kept in damp, but not wet, sand and in a cool place away from the sun's rays until needed for use. The grafting should be done just before the stocks begin to grow as it is very difficult to make the proper union if the bark will slip.

Budding may be done at any time when there is a full flow of sap. Plate or ring budding is usually the most successful. The budding should be done when there is cool weather, if it is possible to select such weather, as drying winds are very trying to the newly inserted buds. Shingles may be used to shade the buds on young trees.

Budding of apricots is usually done in June or early in July but will succeed at any time the sap flows freely.—J. B. N.

Can any subscriber answer where to get pure rubber?

Poison for Rabbits.

Will you kindly inform me through the columns of the Cultivator how to get rid of wild rabbits? Can a person poison them and what kind of poison shall I use? They are very thick.—H. K. L., Imperial.

Watermelon or cantaloupe rinds

with strychnine will get some of them, though if they have plenty of their natural food to run to they may not notice your poisoned bait. When they exist in large quantities, the entire community joins in a rabbit drive; results in killing them by the thousands and is effective. If this cannot be done and you are single-handed and alone in the fight the rabbit fence about the place is the best and surest protection. If your trees are molested, you may save the trunks by smearing with bacon grease or any rancid or refuse grease.

Or, here is another poison: Take 100 pounds of wheat, nine gallons of water, one pound phosphorous, one pound sugar and one ounce of oil Rhodium. Boil water and phosphorous; let stand then add flour to make the paste with which mix wheat and scatter when rabbits are thickest.

Trapping Moles.

How can I poison a mole which is ruining my lawn? M. Y., Pomona.

You will find poisoning almost impossible. The mole is an insect feeder so that he does not take to any bait you may use. His only injury to your lawn is the unsightly ridges. Otherwise the mole is your friend, ridding the soil of just those pests which you want removed. But when on a valuable lawn, or where you cannot permit it to continue, the trap is the only sure way. Very satisfactory mole traps are now made. The "Out O' Sight" works like a charm.

The secret of mole catching is to know the habits and established runways, and the use of a good trap. You will notice in the early part of the season the mole runs show above the ground, and that all that is necessary is to press on the runway, closing it for a few inches, before setting the trap as directed.

During the middle of the summer or later when the ground is dry, moles work deeper; it is then necessary to clean off the grass and dirt to within one inch of burrow, before setting the trap.

Moies have established habitations, usually under fences, walks or rubbish, in high and dry places, with straight runways leading to them, a most suitable place to set the trap. They make many tracks which they never pass through but once and on which it would be useless to set a trap; but if you set it on the main runway you are sure to catch Mr. Mole, and you will soon learn which are the regular runs by depressing the earth; if raised again by the mole, that is the place to set your trap.

In a contest between the Gun Club of Los Angeles and ranchers of the peat lands near the Coast there is promised a strenuous legal fight to see whether the Gun Club can continue to waste the water needed for irrigation, simply to fill the sporting man's duck pond.

We should be trying to find out not in what we differ from other people, but in what we agree with them.—Ruskin.

Whose Mail Box.

If I place a mail box in front of my property, then sell the property and the mail box is not reserved, have I the right to remove the mail box, or is it the property of the purchaser of the property?—C. A. P., Santa Monica.

Evidently the box is fastened to something that is a part of the realty and hence goes with the land and becomes the property of the purchaser.

Eastern Drawn Will.

Inform me if a will made and registered in Massachusetts will stand good in California or is it necessary to make a new will.—Subscriber.

If the will made in Massachusetts complies with the statutes of California it will be good in this State. If you are a resident of this State and have property here it may be safer to make a will complying with the laws of this State. It certainly is the safer plan.

License for Selling.

If I am appointed agent for an Eastern manufacturing firm and wish to sell goods in California, will I have to take out a license.—J. H. R., Santa Rosa.

It depends upon what your are selling and whether or not the counties, cities and towns in which you sell require licenses. It is a matter of local requirements. Make inquiry from the proper authorities in the respective cities and towns in which you desire to sell.

Hedge Fence Ownership.

If a hedge fence has been standing as a division line between farms for twenty years, a part growing to one side, and a part on the other, and one party wishes to cut down the fence, the other party objecting, which of the parties can claim proprietorship?—R. M., Orange.

The hedge belongs to the owners in common. Neither has the proprietorship of the entire fence. They are both equally bound to maintain the fence. I apprehend that neither could cut down the fence without the other's consent.

Liability for Service of Stallion.

Will you please answer the following question through the Cultivator? I bred a mare to a stallion. Afterwards sold the mare to a shipper before it was positively known that the mare was with foal. I stated at the time of sale that the buyer must pay for the service. Buyer refuses to pay, claiming the foal to go with the

mare. Can I be made to pay for the service of the stallion?—A. B., Marysville.

The owner of the stallion has a lien for the agreed price for such service upon the mare, providing he within ninety days after such service filed in the office of the County Recorder of the county where such mare is served or kept a verified claim containing a description of the mare served, date and place of service, the name of the owner, etc. This does not relieve the original owner of the mare for such service although he has parted with her.

CONGO ROOFING

Always Means
A Satisfied Customer

We want every farmer in America to know about Congo roofing. We know that when a practical man sees a sample of Congo he will immediately become a convert. You never saw such values in roofing at the prices of Congo. It comes in four thicknesses, so that you can suit yourself as to the price you pay. Get the sample in your hands; that will convert you. Free sample will be sent on request.

Something About Kellogg's Ant Paste

Lompoc, Cal., July 19, 1906.

Mfr. Kellogg's Ant Paste:

Dear sir—I have been tormented with ants for years and they seemed to get worse every year. I saw your ad in the Cultivator and sent for a bottle tho' I admit I hadn't much faith in it. In fact, kept the bottle in house a week before I tried it. One afternoon I used the Ant Paste according to directions and the ants didn't pay much attention to it and I thought it was a failure like everything else I had tried, but next morning there wasn't an ant in the house. I could hardly believe it. It seemed like magic. I wish every one bothered with ants could hear of and use Kellogg's Ant Paste.

Mrs. Francis Burbridge.

Note to Druggist—You can get this from your Supply House, or write to the manufacturers,

Kellogg Ant Paste Co.

The Produce Markets

Los Angeles Markets

Cutter.

LOS ANGELES, July 17.—Butter has recovered its set back and has made a slight advance and predictions are free that this week will yet see another mark up. In any case the market is well cleaned up and some difficulty is found in filling immediate orders.

Creamery extra.....57½@60
Creamery first.....55
Dairy.....50

California Anchor.....17
Cal 3-lb. hand.....20
Northern fresh.....16½
Domestic Swiss.....23
Imported Swiss.....30½

Eggs and Poultry.

Large quantities of Eastern eggs are being received, but of poor quality. They are sufficient however, to prevent any marked increase. Quotations are higher than last week, but some claim no further advance will be made soon. There are also large quantities of storage available.

The prices given are those of the commission man to the retailer.

Eggs local candled.....23½@24
Eggs case count.....21½

The following are average prices which dealers pay to producers for live weight.

Hens, per lb.....12

Eggs and Poultry.

The stock of eggs is about out. However the price has advanced slightly since last quotation. Further advance may be slow but it is claimed to be sure.

Fresh ranch eggs.....1.50
Eggs, first, per doz.....1.50
Eggs, seconds, per doz.....1.50
Eggs, thirds.....1.50

Poultry receipts are light but there is a big carry-over stock from close of last week, on some of which dealers were willing to make concessions in price on round lots. Strong fancy stock, however, is held up to top quotations. The general inclination is for young roosters and hens of size and weight. The medium grade stock were very dull and in some cases sales were made at greatly reduced figures.

aches are in light supply and of y ordinary quality, while the prices held above the standard which ould permit them to figure largely the retail trade. Some very fair ck, however, is offering at \$1.00 per x. Apricots are very scarce and are d firmly at the quoted rates. Re- pts of grapes are light and the high ices at present ruling seem to be ll sustained. There is a small in- ury for Bartlett pears, but sales are t very extensive. Watermelons are ntiful and prices are marked lower. erries are rather scarce and fancy ck is extremely so. In the berry arket there is some inquiry for Lo- nberries and blackberries, both of hich are more steady in price than ey were. Citrus fruits sell rather owly with prices steady.

Frequently the Cultivator receives a letter from men who want some position on a ranch, or from parties who are competent to take charge of stock, fruit or poultry ranches. Very often we receive letters from parties asking us if we can furnish the name and address of some one competent to take charge of such property. Without we assume the trouble of making a special agency, it is impossible for us to keep track of those requests. We think that Mr. S. E. Gregg, of Riverside, who advertises for a man wanted to take charge of a poultry ranch, solves the problem

Man Wanted

A Practical Poultryman to take charge of one of the best equipped chicken ranches in Southern California. Must be sober and industrious. To the right party a very favorable proposition will be made. Call on or write

S. E. Gregg
126 So. Adams St. Riverside, Cal.

The Auto-Fedan Manufactured by
THE AUTO-FEDAN HAY PRESS CO.
No. 28 Jefferson Street Topeka, Kansas

Grading Potatoes in California

THE securing of seed for the fall crop is of importance, yet too little thought of by the ordinary planter. Any little "nubbin" will answer for seed, so it has an eye, is the belief of many. On this point, Mr. Bennett, the potato expert of the Colorado Agricultural College, writes:

The erroneous idea prevails among farmers that anything in the shape of a potato that will grow is good enough to plant. Sometimes the culls and badly-sprouted potatoes are planted and a good crop results. Sometimes a good colt or a calf comes from a poor, scrawny sire or bull. This does not prove, however, that such stock is profitable in the long run to breed from, and the law that "like produces like," is just as true with vegetables as with animals. Nature always attempts to produce a perfect specimen of any species, but this is hardly possible when the poorest specimens are used year after year for the parent stock. The same care should be exercised in selecting the parentage of vegetables that is used in selecting animal stock for breeding purposes.

The first thing in selecting seed, is to have in mind the most perfect type of the variety being handled. Pick out and save only

those tubers that approximate to the ideal type, and are firm and unsprouted. This will necessitate the handling of several times the amount of potatoes that it is desired to plant, but will prove a valuable investment of time.

The object to be attained in this selection is ultimately to increase the yield and improve the quality of the potato. That this can be done has been proved, for where selection was made from the hill at one of the government experiment stations and planted beside potatoes taken from the least productive hills, the results showed an increase of more than 200 per cent.

A word as to the handling of seed after selection from the stock may be timely.

After warm weather comes on it is difficult to prevent potatoes from sprouting and thus becoming weakened. If they are spread out thinly on the ground or floor of the cellar where they are exposed to the action of the light, this trouble will, to a large extent, be avoided. The seed will also be greatly benefited by the action of the light in "greening" the tubers, and also in destroying the fungous disease spores that are present in great numbers on the tubers.

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropico, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,
Yours very truly,

THE ANAHEIM PRODUCE CO.,
By E. B. Barry, Manager.

"Green Bugs" and Their Destroyers

The Famous Little Insect Which Has Aided in Making
"Dollar Wheat" by His Depredations in Western Wheat Fields

THE papers have had much to say of the "Green Bug" and its depredations in wheat fields to the extent that threatened shortage of the crops caused a stiffening of the wheat market, at least it was one of the causes, and interest is strong as to the life of this bug. This bug is one of the plant lice family, so destructive to vegetation. The description here given is written by Prof. L. C. Riddle-Smith and appeared in the Kansas Farmer, to which paper we are under obligations for the engaving of the bug and its most destructive parasite.

Prof. Riddle-Smith says:

So much space in the daily papers has been devoted to the "green bug" and so many inquiries have been made concerning its identity that it is a pleasure to comply with the request to tell something of the life history, relationships, habits and enemies of this unwelcome visitor. The insect which has wrought such havoc this spring is known to scientists as *Toxoptera graminum* Rond. It belongs to the order Hemiptera. This order is usually subdivided into three suborders; the true bugs including the familiar water-bugs, bed-bugs, box-elder bugs, etc.; the parasites or lice; and the group including the cicadas, leaf-hoppers, scale insects and plant-lice, to the last of which *Toxoptera* belongs.

Description.

Plant lice are familiar pests in all parts of the country and on many different plants. They always do more or less damage especially when the plant attacked is of any economic importance. The exceedingly small size of the insects enables them to do considerable damage before they are noticed. They rarely attain to the size of one-fourth of an inch and many are only one-twentieth of an inch in length. They are usually green in color, especially if feeding upon the green part of the plant; and this is another reason they are so inconspicuous. The body is more or less pear-shaped; the wings, when present, are four in number, delicate and transparent, and the first pair is the larger. They have three small simple and two large compound eyes, slender antennae, and on the sixth segment of the abdomen is a pair of honey-tubes which give out a sweet excretion called "honey-dew," of which ants are very fond. This honey is produced in such abundance that the presence of aphids or plant lice can often be detected by the sticky spots under the tree.

Cared for by Ants.

It is reported on good authority that ants will carry the eggs and the adult females into protected places for the winter and in the spring replace them on their chosen food-plants and protect them from enemies, stroking them on the back with their antennae until drops of honey exude, and then gathering it. For this reason aphides are often called "ant cows."

The life histories of the different plant-lice are very similar. The adults may be winged or not. Just when to expect winged individuals is hard to predict. Often the males as well as the females are wingless. Males and egg-laying females usually appear in the fall. They mate and the female lays a few eggs which do not ordinarily hatch until the following spring. The females congregate during egg-laying; and this sometimes leads the observer to think that the

large number of eggs are laid by a single female, but careful observation has shown that one, two, or in some species four eggs produced by each individual is the usual number. From this fall-laid egg hatches a wingless individual called a stem-mother.

Some Hard Names.

There are various terms applied to this wee insect that are sometimes appalling to the unscientific because of their length and difficulty of pronunciation. She is said to be viviparous, parthenogenetic, agamic, apterous, etc. The term "apterous" refers to the absence of wings; agamic means that she is what is sometimes called a

the field throughout the entire winter if the season is not too severe. The usual number born from a single mother in one day varies from three to seven. Enthusiastic mathematicians have consumed much spare time figuring up the number of descendants from a single mother during one season, the space they would occupy if placed end to end or side by side, their total weight, etc.

The insect now working on the wheat is not the only aphid that has done injury to wheat fields. There are three aphides which resemble each other so closely that chance observers would scarcely be able to detect the differences. The wingless individuals are still harder to separate. Entomologists, even, need the aid of a microscope to be certain. The three are known as *Aphis mali* Fab., *Nectarophora avenae* Fitch (*Siphonophora granariae* Kby), and *Toxoptera graminum* Rond. Prof. F. M. Webster has made careful studies of all three and found each and every one infesting wheat fields and not infrequently all three together, with one or the other predominating in numbers.

Aphis mali is known as the apple plant louse, but it does far more injury to wheat than to apples. The winged viviparous females migrate to the wheat when it first sprouts in the fall and feed near the ground on the stem. For the reason that it is of greatest injury to wheat in the fall, it is sometimes called the "fall wheat-louse." It can be distinguished from the other species by the absence of frontal tubercles on the head where the antennae are attached. This aphid lays its eggs on the bark of the apple tree and hence late fall and winter spraying of apple trees is beneficial to the wheat.

It is claimed by some field observers that *Toxoptera* can be detected by its black eyes and a light stripe down the back. The eyes, tips of the honey tubes, extremities of the legs, and outer two-thirds of the antennae are dark; and the normal position of the antennae, laid directly back, does give the lighter effect, without the actual stripe being present. Specimens used in illustrating were not striped to any marked degree, at least not so noticeably as the stripe that can be seen in the aphid on box-elder, which might be mistaken by the chance observer for *Toxoptera*, if much emphasis is placed on the striped appearance. Black eyes are not distinctive marks, either, for *Aphis mali* has black eyes and those of *Nectarophora* or *Siphonophora* are so dark a red that they might be easily mistaken for black.

Nectarophora avenae has long been known as the "grain aphid," and "wheat plant-louse," and has from time to time done much damage to cereals, more especially in the Middle and Eastern States. It has been described under various synonyms in both England and France, and is probably an imported species. It did much injury to the wheat in Illinois in 1866, again in 1876; and like *Aphis mali* appears in the fall of the year.

Toxoptera graminum Rond. was first described in 1852 by Dr. C. Rondani from Bologna, Italy, and was not known in this country for thirty years, hence it is also considered an imported

a, wingless female of *Toxoptera graminum* with larval parasite showing through body wall; b, pupa of *Toxoptera graminum* (note the wing pads); c, winged adult of *Toxoptera graminum*; c. v., cubital vein forked but once; t, frontal tubercle; d, *Lysiphlebus* sp. (female), the parasite most destructive of "green bugs;" e, wing of *Nectarophora* showing cubital vein, c. v., branched twice. (All from original drawings.)

"virgin mother" and produces young without union with a male insect; "parthenogenetic" is another way of saying the same thing; and the term "viviparous" means that the young do not hatch from eggs but are born alive.

Now this odd method of reproduction has been carried to a remarkable extent. These stem-mothers give birth to living young when about one week old, and these in turn mature in the same length of time. The period during which a female continues to bear young is usually from two to three weeks. Usually the offspring have no wings but after moulting three or four times during growth become mothers. Still we can nearly always find some winged individuals in a colony and these winged forms are the migratory females that seek new feeding grounds and facilitate the distribution of the species. The bringing forth of living young by virgin mothers has been recorded by European investigators through over one hundred generations without the occurrence of any males. It has been continued through over four years by Cornell University experimenters and occurs normally in

Deciduous Fruit Culture

ZANTE CURRANTS.

THE dried currant of commerce is not the dried fruit of currants as is frequently supposed, but is the product of a grape vine. Since the Thompson seedless has been so extensively planted in California, the market has taken large quantities of the dried product and the Thompson seedless makes a better quality of goods than much of the foreign material that is imported. The true Zante currant is grown in various parts of California, but not so extensively as the Sultana and Thompson. The latter is the most prolific of the three and makes the best looking dried fruit. The berries are larger and of an amber color.

The imported currants come principally from Greece and often the crop is damaged by rains during the curing season. This helps the California seedless grape growers during such seasons, but perhaps more benefit is derived by the California product getting a hold on the market. The product that is imported comes in barrels and with it sometimes a large amount of dirt. Even after such currants are washed they are unfit for use. This grade is of course, not the best or perhaps even the average, but it finds sale and the California product should and will in time take its place.

The true Zante currant is quite

widely grown in California and in some sections is very prolific. There are two varieties of this fruit, the white and black. The latter always bears a seedless grape of small size and can be relied on in this respect, but the black variety will often produce berries of large size and full of seeds. Often half of the berries on a bunch will be over size and full of seeds. It is worthless as a currant or for any other purpose.

While Thompson seedless is being placed before the consumer, as a substitute for the Zante, there is considerable difference in the flavor of the two. The Zante contains more acid than either Thompson seedless or seedless Sultana, which gives the peculiar tart flavor to cookery.

The California dried currant supply has heretofore come from the northern part of the State, but the desert regions have shown results that seem to forecast a strong competition with some advantage over the northern sections, in the matter of curing the crop.

NUTS.

The almond crop in various parts of the State bids fair to be heavy. No late frosts or unfavorable spring weather has interfered with the setting and trees which are seldom with a crop, are full this season. This is especially true in Southern California.

All nuts bring good prices every season and there is no reason why many irrigated farms growing alfalfa and various crops requiring irrigation, should not work in many nut trees along fence lines and irrigation ditches. We know of almond trees growing in the Sacramento Valley, that produce as large an income per acre as the alfalfa does. The trees provide shade for the stock during the hot summer and the nuts were gathered from the trees by knocking them off onto sheets in the usual manner without turning the stock out during the harvest season. We one time helped harvest a crop of almonds under these identical conditions. The almonds netted the farmer \$100 per acre that season and at the same time the land was used for alfalfa and stock. This is not usual, but it helps to keep the pot boiling. The trees were trimmed high so that the nuts could not be reached by the stock. We do not advocate handling orchards in this manner, but there seems to be no reason why pasture lands cannot be so handled with advantage to the grower. Stock should have shade and trees planted for shade can be made to more than pay their way.

When blighted portions are cut from twigs of trees they should be at once burned. The dead wood really contains no live blight spores, but the point where the living tree comes in contact with the dead part may.

FRUIT DRYING.

I have failed to see anything in the Cultivator about drying fruit. I am going to tell about my experience last fall and I have dried fruit for years, yet this was a lesson to me.

I risked putting in the bin a good many apples not thoroughly dried, thinking the ones that rattled would absorb the moisture from the wet ones. I found out that it is not a good plan when there are several tons in the bin. I believe it is good to have them so that they can be stirred occasionally. I did not leave room for this and was sorry for it afterwards.

I kept piling them up in a bin until I got ready to pack them, and the consequence was, when I got down to the middle I found my apples pretty soft, and some had moulded. Now, to look at the top of the bin they were the finest lot of apples I ever saw.

Do most people make a practice of stirring up their fruit, when it is in the bin and do people fumigate their apple houses to kill the worms?

I have heard people say they could not understand why their fruit became wormy so quick. I understand. It is because the old bins are full of worms all the time. If we tear one to pieces we will find them. They should be destroyed before new fruit is stored.—C. J. C., Sebastopol, Sonoma Co.

Record of Mrs. Vrooman's Franquette Walnut Grove Since It Began Bearing:

OREGON NURSERY COMPANY, SALEM, OREGON:

Gentlemen:

You ask me to give you a report of the increase of my Franquette walnut trees since they began to bear. Happily I have the figures at hand:

When 3 years old, 1901.....	82 lbs.
When 4 years old, 1902.....	520 lbs.
When 5 years old, 1903.....	3,700 lbs.
When 6 years old, 1904.....	6,000 lbs.
When 7 years old, 1905.....	12,325 lbs.
When 8 years old, 1906.....	24,314 lbs.

The output has practically doubled every year since the trees came into bearing.

(Signed) MRS. E. M. VROOMAN.

Walnutmere, Santa Rosa, Cal., Nov. 22, 1906.

This 55-acre grove is planted with 1000 First Generation Franquette trees grafted in a direct line from the original Franquette tree in France and is the only large, grafted bearing walnut grove in the world from which seed stock and scions for grafting purposes can be secured.

We have contracted for the entire output of both nuts and scions for three years, which gives us absolute control of the product of this, the world's greatest, grafted walnut grove.

Last year, 1906, eight years from planting, we paid Mrs. Vrooman, \$6,140.-55 for the crop of nuts; over \$100 per acre.

Write for FREE BOOKLET giving full information of the LARGEST stock of FIRST GENERATION GRAFTED and SECOND GENERATION walnut trees in the world.

REPORT ON PLANT DISEASES.

The Experiment Station Record refers to a valuable report made by Ralph E. Smith of work during 1906, the principal investigations having been made on pear blight, walnut blight, peach blight or shot-hole fungus, tomato diseases, and asparagus rust. In addition, investigations have been begun on rose diseases and citrus fruit diseases.

The pear blight work is largely in coöperation with the Bureau of Plant Industry of this Department, and consists in the application of the methods recommended by that Bureau. A detailed account of the investigations in the different counties is given. It has been found that thorough winter pruning prevents blossom infection in the spring, and that the larger the district covered in the winter the less will be the infection the following season. Frequent and prompt summer cutting is to be practiced, and if not exposed to extremely abundant infection, a pear orchard can be profitably maintained in good condition.

The walnut blight investigation has been a continuation of studies on the bacterial disease of walnuts due to *Pseudomonas juglandis*. Thus far the disease has proved difficult to control, as spraying experiments have not been very successful. The size of the trees made spraying almost prohibitive, on account of the difficulty and expense.

The beet blight described appears to be due to a derangement in the normal functions of the plant, and investigations seem to show that by attention to planting and cultivation in connection with weather conditions the disease may be largely controlled.

The peach blight or shot-hole fungus reported upon is due to a species of *Coryneum*, and spraying with Bordeaux mixture proved quite efficient in controlling it. In addition to the peach, the almond is subject to this disease, and probably the fungus will be found to attack other stone fruits.

The other investigations are briefly described, and the bulletin concludes with a list of the more common plant diseases that have been observed throughout the State, with notes as to their relative importance.

HOME-GROWN TEA.

The United States Department of Agriculture will shortly issue a Farmer's Bulletin (301) entitled Home-Grown Tea, prepared by George F. Mitchell, Scientific Assistant, Bureau of Plant Industry.

The bulletin describes briefly the methods of growing tea plants and the handling of the same for the production of tea. A practical method is described for the making of tea from the fine leaf, using only such pieces of apparatus as are found in every kitchen.

The bulletin will be of particular interest to persons throughout the South who may desire to grow tea for home consumption. It is illustrated by four text figures.

Copies may be obtained by application to the Secretary of Agriculture, or to Senators, Representatives, and Delegates in Congress.

APPLE SHIPPERS.

The thirteenth annual meeting of the International Apple Shippers' Association will be held at the St. Charles Hotel, Atlantic City, N. J., Wednesday, August 7th, 1907, for the election of officers for the ensuing year, and the transactions of any business properly coming before the meeting. There will be interesting addresses pertain-

ing to apple-growing, packing and marketing, committee reports, and discussions.

D. O. Wiley of Detroit, Mich., is President and A. Warren Patch of Boston is Secretary.

Now is the time to watch the yellowish white grub about one inch long which bores beneath the bark at the lower part of the trunk of the peach tree and about the roots. These grubs are larvae of winged insects, looking something like small wasps. If you see gummy material at the surface of the ground about the trunks of your peach trees, assume that the grub is working there. From June 1 to August is the season during which the grub is most active. Peach growers have learned to protect peach trees by removing the soil at the base of the peach tree, then winding stout paper about the lower part of the trunk as close to the roots as possible, thus keeping away the insects which lay the eggs which produce the grubs. But first the grubs must be removed that are already at work. Others place wire screens about the base of the peach tree.

The water-holding capacity of a soil depends largely upon its physical texture and is also influenced to some extent by the amount of organic matter present. For instance, a heavy clay soil containing a large amount of humus might hold thirty per cent of water and still be in workable condition, while sandy soil having ten per cent of water might seem very wet. It is, therefore, obvious that when success in dry farming depends upon the storage in the soil within the reach of plants of enough water to carry a crop to maturity, the water-holding capacity of the soil becomes a matter of the first importance.

Potash

is the Gateway to Big Grain Crops

Grain can't grow without food. It must get it from the soil. It is for the farmer to see that his soil has enough of the right kind of plant-food necessary to the kind of crops he grows.

The fertilizer for Wheat, Rye and Barley should contain at least 6% Potash. Rather than risk an under-supply, mix Muriate or Sulphate of Potash liberally with the fertilizer before applying.

Send for our free books on growing grain. They won't give you theories, but facts on how the right use of Potash has turned poor soil into good soil, and made good soil better soil.

GOMBAULT'S CAUSTIC BALSAM

A safe, speedy and
positive cure for

Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

Lost Strayed or Stolen—One Cow

That is about what happens each year for the man who owns five cows and does not use a **Tubular** cream separator. He loses in cream more than the price of a good cow. The more cows he owns the greater the loss. This is a fact on which Agricultural Colleges, Dairy Experts and the best Dairy men all agree, and so do you if you use a **Tubular**. If not, it's high time you

did. You can't afford to lose the price of one or more cows each year—there's no reason why you should. Get a **Tubular** and get more and better cream out of the milk; save time and labor and have warm sweet skimmed milk for the calves. Don't buy some cheap rattle-trap thing called a separator; that won't do any good. You need a real skimmer that does perfect work, skims clean, thick or thin, hot or cold; runs easy; simple in construction; easily understood. That's the **Tubular**, and there is but one **Tubular**, the **Sharples Tubular**. Don't you want our little book "Business Dairy men," and our Catalog A. 380 both free? A postal will bring them.

BUILDING THE SILO.

(Continued from last Week.)

The Foundation.

FOLLOW line marked for circumference of silo, digging circular trench for the foundations. If the silo is to be put down five or six feet under the ground, then the entire circle is dug out for the cellar. If the silo is to stand on the surface, then throw the earth from the trench into the center to raise it a little. The silo that stands all above-ground should have a wall three feet high, two feet in the ground and one foot above the ground. The bricks or stones used should be free from dirt and plaster and laid with good cement. Bricks are soaked over night, and stones are put in wet. Then the cement grips them and all the mass becomes solid and unbreakable. Sills.

Under the last courses of bricks or stone, put in long bolts with wide heads and nuts on the other ends. Firmly fix the ends into the wall and leave them long enough to run through the sills. Place a bolt to every foot. This means two to each piece of sill. The sills are two feet long with the ends cut on a slant of sufficient angle to make them fall into a circle. By reversing every other piece there is no loss of lumber on these cuts. The sills should be cut and ready to be put on the brick foundation as soon as it is completed, bedding the sills into the cement while it is still wet. The bolt comes up through the sills and the nuts are screwed down holding it all firm.

Plates.

In cutting the sills I have the man doing this work go right on and cut the plates. Double the number of plates, or twenty-six for a twenty-six foot silo, while thirteen sills are required. I have the sills made from four by fours, and use two by fours for the plates. Commonly the sills are two by four made from the same stuff as the plates. This I know is heavy enough. I started to use two by four but was afraid it was too light and used heavier lumber. At that time having never put up a silo, I was timid lest I should not make it as strong as it should be to stand the strain.

The silos and barns were planned to meet the requirements of the ranch, not according to set plans. Now by studying and measuring the boards carefully it was possible to build with economy. The lumber was bought by the sloop load at the docks and often overran the amount needed so that by having a number of sheds and lesser buildings in mind a saving was made. For instance, a board or post that cut to the end of the stick would leave a piece of unusable size, by stopping half way would leave a post or plank ready cut for another building.

Studding.

After the sills are in place, space them every foot on the outside edge for the studding timber. Make a heavy black mark so that there can be no uneven spacing. These studding are two by fours, sixteen feet long, standing with the narrow side in. The half of the studdings may be fourteen feet long. Stand up a studding piece, toe nail it to the sill and have a man hold it in place until the opposite one is

in place, then nail a scantling across to hold them up, repeat this until enough are up to make a heavy square frame in the center. Do not trust a single studding to keep straight except it is nailed firmly. I have seen several silos built that this was neglected with the result that the silos are not true, the lining breaks every year, and are an annoyance and expense to the owners. Use good heavy spikes in toe nailing the studs into position, for the pressure comes on them at bottom.

Bracing.

The extreme importance of bracing well during the construction cannot be too strongly dwelt upon, else, like the Tower of Pisa, it will be a constant source of explanations until the people learn to accept its wobble and admire the Leaning Silo. The pressure inside the silo must be carried evenly or else it will not be strong enough to last long. These braces are nailed to legs and stand up inside the silo for scaffolding after they have been cut loose from the studs, so they should be carefully placed in regard to being near enough to put on the lining boards.

Lining.

The cheapest lining for a silo is fenceboards ripped down the center into three-inch stuff. Begin at the bottom and nail in a circle around and around until the first six feet are up. Then prepare for the doorway. Cut out two of the studding beginning six feet from the floor, take out four feet in length. Fit the pieces cut out across the top and bottom of the frame. Nail it firmly into place. Make a frame two inches smaller than the opening, stiffen it by two pieces of two by two down the center in a line with the cut studding. Set a couple of blocks on the center of the door frame and with a slat or two nail it firmly on the outside of the silo timbers. Have the inner side of the frame flush with the inside of the silo. Then continue the lining carrying the boards around and around, when the opening is reached nail the lining doubly around it and also nail it securely to the frame. Two feet above the first opening, make a second doorway in the same way. The first opening is six feet from the ground; doorway four feet—two feet of silo wall,—then second door—two feet more of wall—then a doorway. This allows for four doorways, I have it so in the present silo. Now, if I were building again, I think three would be plenty.

Studdings Lapped.

Nail the studdings on top of those in place allowing two feet for a lap. I say nail, but I have mine bolted. Put them on the sides not on the inside or outside. Carry the lining well up before putting on the plates. The first series of plates, stand the plate so that the ends do not rest on the ends of the studs. Nail securely. The next or second series put on so as to break joints with the first. Nail firmly and complete the lining to the top. The next thing is to tar the lining to the top with coal tar. This is applied hot, but if it cannot be readily done the coal tar is cut with gasoline and put on with whitewash brushes. I could not secure coal tar while building the round silo, so used the liquid asphaltum. It seems to have been successful as the silo has

SORE SHOULDERS

I would like very much to personally meet every reader of this paper who owns any horses that have sore shoulders and tell him about Security Gail Salve. This is impossible so I am going to tell you through the paper.

You and I both know that horses working with sore shoulders are in pain, and that they can't do as much work without running down as when they are free from pain. I also know perfectly well that Security Gail Salve will cure these shoulders, if you do not know it. If you did you would buy it of your dealer at once and cure them up. For I have no doubt often wished that you knew of something you could rely on. You can rely absolutely on Security Gail Salve. It will do its work every time or if you prefer to try it first I will mail you sample can free. Just write for it—it will go to you on first mail.

Also I want to tell you that Security Antiseptic Healer is as good for barb wire cuts as Security Gail Salve is for harness galls. Dealers carry it in 25c, 50c and \$1.00 sizes. Use them for your need, guarantee you perfect satisfaction.

ated well. It did not dry readily and the tarred paper stuck to it as put it on.

Tarred Paper.

The next layer is tarred paper. Begin at the bottom and lap carefully the seams having the folds in the boards downward so moisture will not be held. Tack carefully at the ends, then shift a little further on each section so as not to have all the tackings come in a direct line. It is firmer when done this way. I cut the ends at a slant with the long end up so that no dampness is held in one spot. Tack securely where the frames of the doors are and along the edges, leaving a convenient line without nails or tacks to saw out. After the tarred paper is in place, put on the second series of boards, around and around, using a four-inch board at the bottom to start in with, will break the joints all the way up. These inner boards are usually good lumber and must be planed on the inner side.

Lining.

After the lining is in place before the final tarring it is better to saw out the doors. Saw these with a slanting cut between the edge of the door-frame and the door. The slanting cut is made leaving the longest edge on the inside. This makes them close more closely. Hinge the doors with a close hinge and shut them tightly into place. Then tar the inside completely over. I do not think it hurts to give the silo all the tar that is left; had two coats on the inside of mine. The gasoline used to cut the coal tar is simply stirred into the tar until it is thin enough to put on with whitewash brushes. It is quickly brushed on and dries at once.

Outside.

The outside of the silo is now ready to have the rustic. We did not find it necessary to put any tarred paper on the outside of the silo under the rustic. In the East it is customary to do so, to control the severe cold. The outside is planed six-inch house rustic in sixteen-foot lengths and is put around continually to the top. The boards should be stacked up loosely where they may dry out. Fit the boards well, using four nails in each studding and at the ends. If a board does not reach to the next studding do not nail a short block to the inner lining to nail it to; this is simply weakening the silo; cut off the end and nail it firmly to a stud. Fastening the ends of the outside boards of a silo is as necessary as a big hard knot in the end of the thread when the head of the house sews on a suspender button.

Doors.

When the door places are reached put in a frame the same as on the inside and nail right over it. After the rustic is on cut out the doors making them to open outwardly. A handle is screwed strongly to the outside doors to open them with. The edges of the inner doors have tarred paper nailed lightly on them, then the outer door is closed firmly; a heavy iron latch made at home is next put on the outside. On the round silo I have a second outside sill nailed for the door to close on more tightly. At the bottom near the sills and at the top on the outside, between studding bore a hole only through the outside rustic, to let out condensed moisture. The silo sweats like an ice pitcher in the cool weather.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Roof.

Roof can be made as simple or as elaborate as desired. The simple roof is merely a series of slats. A prettier roof is by using a round piece of mill-work with a square base and nailing rafters to this cutting the ends on a slant so as to raise the center. This is shingled all over except a place large enough to hold a square dormer window. This is built on the ground like a large dog kennel and then put in place with its weight largely thrown on the silo wall, and on two rafters. Before putting on the roof all inside scaffolding is removed, only the outside remains in place.

Roofless Silos.

In California the silo does not need a roof as the rain that falls here is not enough to hurt the silage. The last fitting before painting the outside is putting on an outside ladder; this is best made of iron pipe and should be screwed to the studding at every round.

Painting.

The outside of the silo can be painted cheaply if cement and milk paint is used. Two pounds of cement, half a gallon of milk, and two pounds of powdered paint. Only mix a little at a time and keep it well stirred; paint it on with a whitewash brush. I have had some of this paint on a barn twenty years and it does not look any more shabby than a barn painted eight years ago with good oil paint.

THE MILKING STOOL.

More than one farmer's heifer has been injured by the absence of a proper milking stool. Sitting on one's toes becomes tiresome after a time and in the case of a heifer whose undeveloped udder renders the job of milking her a rather tedious one, the last end of the milking is pretty sure to get slighted unless the milker is in a fairly comfortable position. That means a spoiled cow presently. By the way, did you ever think how much unnecessary weight from the arm is thrown upon the cow's udder by using that ridiculous low stool? Just try a higher one and see if it is not a great deal easier upon the arms, then ask old Brin what she thinks about it.

HOLSTEIN-FRESIAN TRANSFERS.

COWS—Bonitette of Riverside, Chas. D. Pierce to J. H. Kaufman, Newman, De Natsey Baker, Chas D. Pierce to J. H. Kaufman, Newman.

BULLS—Prince Orleans Longfield, A. C. Demerit & Son to Leland Stanford Jr. University, Stanford University. Sir Josephine Abbeckerk Gerben, J. H. Williams to California Hot Springs Co., Hot Springs.

PLACE FOR THE LANTERNS.

A place should be provided in every farm building where lanterns are used or likely to be used. Stretch a wire along behind the cows and horses with sliding wire hooks onto which the lantern can be hooked and moved as wanted. A hook of cheap, smooth fence wire can be fixed up without expense almost anywhere, and it is much safer than a nail, as it will generally allow the lantern to hang straight. Be careful that no hay, straw or other inflammable material is near lantern hooks or other holders. Don't set a lantern down.

H. Miehle, a large dairyman near Venice, has just received a car of fine Holstein cows from his ranch at Newman, Stanislaus county.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

The Simple U.S. CREAM SEPARATOR

See the gear wheels and the bowl. They are all the "machinery" there is to the U. S. Cream Separator. They do the business. The bowl skims the cream from the milk by whirling around several thousand times per minute. The gears get up this high speed although the crank is turned only about 50 turns per minute. You get the idea. It's much the same as a mower's gear which makes the knives move very fast while the drive wheel turns slowly.

Now a Cream Separator runs at a very high speed. For this reason there is bound to be considerable wear on it. So to last for a long time a separator must have but few parts and have those parts simple and easy to get at. The construction of the U. S. is simplicity itself (the cut shows). Of course the U. S. gears are entirely enclosed by a strong iron frame when set in the separator ready for work.

We want to tell you more about the simple construction of the U. S. Separator, and about its many other good points, too. Our handsome, new catalogue will do it, and make mighty interesting reading. We'll gladly send you a copy free if you want. Just write "Send catalogue number E 20". A postal is all right. Better write now while you think of it, addressing

The Ornamental Garden

PALMS FOR THE HOUSE.

WHILE many of the palms and ferns are admirably suited to culture in the living room, the mistake is frequently made of obtaining those that will not do well in such locations, the novice probably basing her choice on specimens seen in the windows of the florist, and forgetting that such plants were only brought to such perfection in the temperature of the greenhouse and in skilled hands. Since the introduction of the Boston fern, *Nephrolepis exaltata Bostoniensis*, lovers of this class of plants have had greater success and certainly no plant is more easily cared for nor gives greater satisfaction in the living room. It will stand considerable rough handling, and is quite as attractive in the summer for veranda decoration as in the winter used on the tables and stands.

The kentias among palms are peculiarly suited to the home. They are scarcely ever attacked by insects, and even gas, coal and illuminating—the bane of most palms—fail to injure them seriously. Notwithstanding the sturdiness of the class, the foliage is graceful, of a pretty shade of green, and always attractive. Kentia Belmoreana is the best known of the class, although Kentia Fosteriana is quite as attractive, being of taller growth and not so spreading as the first named.

In growing palms considerable moisture is needed at the roots, although the soil should not be allowed to become soggy at any time.

ORCHID BRINGS NEARLY \$8000.

In a London exchange a note that a romantic page in the history of orchid culture was closed at Messrs. Protheroe & Morris' auction rooms, when an original plant of *Miltonia Vevillaria Memoria G. D. Owen* and two parts taken from it together realized the sum of £1375 and 10s.

The plants were scarcely more than six inches in height and were quite insignificant looking. They formed part of the "Clara Lawn" collection of the late Sir Frederick Wigan, the three days' sale realizing a total of £4590.

The plant, of which only three specimens exist in any collection, has gained all the highest orchid honors. It is the most wonderful variety of *Miltonia* ever seen, and the wonder of it does not consist in shape or coloring so much as in the fact that in the middle of it is an almost perfect butterfly form, apparently painted on the flower.

The curious resemblances of many orchids to common objects, such as bees, spiders, screws and tresses, consist in the hap of the flower, but in this case the sepals and petals of the flower bear an imprint, and the effect is of a velvety purple butterfly settled on the rich rose ground of the flower.

In eleven years this *Miltonia* had multiplied in value thirteen times. Its history is almost sensational in the light it throws on orchid culture as a speculation.

Messrs. Sander of St. Albans, received one very small plant among other mixed orchids, from their orchid seeker in South America in 1896. They named it after G. D. Owen, a famous collector of bygone days, and sold it for one hundred and five pounds to Sir Frederick Wigan. In

the course of time Sir Frederick divided the plant into three, and the sequel was the 1375 pounds and 10 shillings obtained for the three portions.

It is a curious fact that Messrs. Sander, who, eleven years ago, sold the original for 105 pounds bought back a third of the plant for 441 pounds.

BREEDING FLOWERS.

I have for some years endeavored to procure a double quilled purple dahlia and some four years ago found among my harlequin dahlias one that seemed to me would answer the purpose. It was separated from other dahlias of its own kind and placed among the darkest shades procurable. It responded magnificently so that I have had for three years a double quilled purple dahlia in which every quill is perfect, each one rolling back on the stem making a perfect ball.

By practically the same method with gladiolus, by taking a light canary color and placing it among lighter colors as far as possible and especially among those having a tendency toward green, I now have in my collection a gladiolus that closely resembles the calla lily in color, the flower being a light green on the outside shading down on the inside from almost a white to a golden throat.

These little experiences are not expensive and prove highly gratifying to me as I think they would to others who may be willing to take pains to watch the development of their various flowers and bulbs.—Farmers' Tribune.

CALIFORNIA EUCALYPTS.

Arrangements have been made by the government to continue the investigations upon the California eucalypts under way at the forest service timber testing laboratory at the University of California. A shipment of 104 logs of the different species of eucalypts which have been introduced into California has been secured. This material was cut from the Cooper and Bishop estates near Santa Barbara. The eucalypts are natives of Australia, but seem very well adapted to the climate of Central and Southern California. The wood is dense and strong, and gives every indication of being suitable for many of the uses to which Eastern hardwoods, such as hickory, oak and maple are now put. In addition to these valuable mechanical properties, the tree has a very rapid growth.

CHRYSANTHEMUM GROWER GONE.

"Billy" Marugg whose magnificent chrysanthemums attracted much attention at the last two Southern California Horticultural society exhibitions, died at his home in North Pomona in June.

Mrs. Marugg, his mother, will continue his work of growing more of the floral beauties and asks that her son's old friends continue to send orders for cut flowers and plants.

Allow six inches space for all the ordinary small plants, such as pansies and daisies, and twelve inches for geraniums and other plants of equal size. Verbenas can safely be planted sixteen inches apart and salvia eighteen inches to two feet. Cannas should have a distance of two feet or more.

Kellogg's Ant Paste

Lompoc, Cal., July 19, 190

Mfr. Kellogg's Ant Paste:

Dear sir—I have been tormented by ants for years and they seemed to grow worse every year. I saw your ad in the Cultivator and sent for a bottle tho' I admit I hadn't much faith in it. In fact, the bottle in house a week before I tried it. One afternoon I used the Ant Paste according to directions and the ants disappeared. I paid much attention to it and I thought it was a failure like everything else I had tried, but next morning there was an ant in the house. I could hardly believe it. It seemed like magic. I am every one bothered with ants could do of and use Kellogg's Ant Paste.

APHIDE.

THESE pests are destructive in spring and early summer. They are winged and spread with amazing rapidity over vast areas. Later they become wingless and as they never that state leave the plant on which they are located are necessarily con- sidered to it and live and die with it. This is in this wingless state that the larva of the lady bug (convergents), attack them and usually work their complete destruction. It happens sometimes, however, that a few melon and other plants have been overlooked the pests. If such remain af- ter the first of July they are safe as this time, the ladybug larva have hatched in the mature ladybug and no second brood appears the aphide is safe. But as they are unable to transfer themselves from plant to plant the field is compara- tively safe also, until about the twentieth of August, when the aphide again grow wings and from a few infested hills will cover in less than two weeks all the field. To pre- vent this it is necessary to uproot the infested hills letting them lie where they stood after first fastening them with a little earth so the wind cannot blow them over on the unaffected ones. The aphide stick to the plant like grim death to a nigger and per- haps with it; be sure to uproot the "infected" plant before the aphide get growing wings again.—J. C. Oster- ard.

CUCUMBER BEETLES.

The pest of cucumber beetles seems to be more prevalent this year than usual, and many queries have come regarding them. We quote from the Journal of Agriculture regarding treatment for this pest:

Where only a few cucumbers are grown for home use, the most practical method of preventing the assaults is to cover the vines. Take a barrel hoop, and cut it into two equal parts, or semi-circles. On each side of the plant set one of these half hoops so the circle will extend upward. Over these two bows throw a piece of cheap mosquito netting, covering the edges with a little dirt so the beetles can not pass under the netting to the plant. In this way they can be kept from the vines.

Of course where the grower has more than a dozen plants, this method will not be practical. For the large grower most authorities suggest the application of a number of different sprays, but the writer never had much success with sprays. After kill- ing a number of the beetles there would seemingly be as many of them as before and if the plant were not kept covered with the spray from the time the beetles first appeared till the fruit was gathered, the beetles would destroy it between the spray- ings.

One of the most popular methods of destroying or driving beetles from the plant is to keep it well dusted with air-slacked lime. The application is made in the morning when a little dew is on the plants, and if necessary, is repeated every morning, enough be- ing applied to make the leaves and the ground quite white. It is claimed that the beetles will leave at once.

HOW HE FIXED IT.

A crafty old farmer named Glenn, of harvest hands needed 'bout ten. He got from the city A cook who was pretty He easily hired the men.

HAND PICK SQUASH BUGS.

The common squash bug, or "stink bug," as it is often called because of the strong, fetid odor which it emits, is the worst pest of our winter squash and pumpkins. It is a very difficult insect to kill by the ordinary use of insecticides. Early in the season when the bugs are gathering about the hills of squash, the plants should be visited each morning for the purpose of kill- ing the bugs that may be found upon the under sides of the leaves or be- neath pieces of boards or chips that have been placed about the hills.

At this time of the year the young squash bugs are usually found accu- mulating upon individual leaves and may be destroyed in large numbers by brushing them into a bucket of water with a spoonful of coal oil or kerosene on top. The work should be done early in the morning before the bugs have become warmed so as to become active. I do not believe that it is prac- tical to destroy these bugs with any kind of spraying.—C. P. Gillette, Col. Agr. College.

A GARDEN HINT.

A subscriber at Sebastopol sends the following hint of value to garden- ers:

I find it almost impossible to start my plants without old cans around them. Some one suggested paper for protection. I don't see how any one makes a success of that when we al- ways have rain after the plants are transplanted. Anyone knows what rain does to paper. The can not only seems to keep the cutworm away, but there is a small black bug which eats the leaves, and is prevented from reaching them by a web that in a very short time is woven over each can. After the plant gets thrifty and has a strong fragrance nothing will molest it.—C. J. C., Sebastopol.

BLACK ROT IN CABBAGE.

Perhaps one of the most serious dis- eases which attack the cabbage is stem-rot or black rot. The first symptom of the trouble is a one-sided growth or a dwarfing of the heads; or if the disease got a start very early in the season, there is an entire absence of the head. In the worst attacks of the trouble the plant dies. When the heads rot and fall from the stem, the rotted portion is soft and foul smell- ing. If the stubs are broken or cut through there will be noticed a brown or black ring on the interior. The bac- teria which cause the disease enter the plant above the ground, usually through wounds made by insects known as water pores.

At this time of the year there are but two practical remedies. One is by removing all infected leaves and destroying them. All leaves, whether infected with this or other troubles, should be removed and burned. Any leaf that shows a pale yellow color may be classed as "infected" with some kind of a disease, and should be destroyed. The other remedy is to dust with "dry Bordeaux" to which has been added some good insect powder. The Bordeaux will not only have a tendency to hold the trouble in check, but the insect powder will destroy all cabbage-eating insects. Next year a rotation of crops should be practiced which is the most ef- fective and practical of all remedies.

There is always room at the top if you can push the other fellow off.

Great Western Manure Spreader with Endless Apron

The simplest and most efficient machine ever manufactured. It will handle all kinds of manure—barnyard manure that has been tramped down solid, fresh stable manure, manure that is mixed with straw, corn stalk, or mulch of any kind, and will spread it at a great saving in cost, and in an incom- parably better manner than can be done by hand.

It will turn in its own length; it has covered gear; the seat is hinged to turn out of the way when loading; the wheels track, and it has the lightest draft ever produced on a manure spreader. It spreads thick or thin, just as desired.

Don't let the valuable manures on your ranch be wasted— either from failure to use them or from imperfect hand spread- ing. Descriptive circulars of the Great Western Manure Spreader furnished on application; we will be glad to show the machine to any who are interested.

For use in orange groves and vineyards there is nothing bet- ter than the

Buckeye Fertilizer Drill

We have sold a great many carloads of these drills in South- ern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired make it especially adapted to orchard use.

Both of the above machines are the best of their kind; REMEMBER THAT

A. L. Fratt, Ventura, Cal.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

COAST NURSERYMEN AND CHERRY GROWERS OF OREGON.

THERE was recently held in Salem, Oregon, a cherry fair and a convention of the nurserymen of the Pacific Coast. Both events coming together, attracted a large number of people, not alone from Oregon, but from all the surrounding States.

In connection with the Nurserymen's Convention, there were representatives from the State Horticultural Commissions of Oregon, California, Idaho and Washington. The event brought together three classes whose labors and interests are identical—the fruit growers, the nurserymen and the horticultural commissioners and inspectors. Very many matters of importance to the fruit industry as a whole were considered, many points of difference explained away, and, as a result of this joint meeting, there has been established a feeling of harmony which cannot but result in better work and better results.

The local feature was, of course, the display of cherries, and it was one of unequalled merit. The Oregon cherry season is much later than that of California, the great bulk of the crop there coming in after the greater part of ours has been disposed of, but over a great part of the State conditions are especially favorable for this fruit and the display here made, indicated at a glance what could be done.

The Oregon people have hit upon one attractive feature, that of making mass displays. The commercial advertiser appreciates this and the show window decorator knows that there is nothing will win the public eyes so quickly as a mass display of any object. So, in her fruit fairs, Oregon has apple fairs, cherry fairs and other displays of specialties and they attract attention when a mixed display would confuse the spectator and the desired effect be lost. It is this which makes our citrus fairs always so taking and which is lacking in the general display of the country fair.

Here we have masses of cherries; cherries of all varieties in competition on their merits and certainly it would be difficult to bring together a more attractive display or a display of finer fruit.

The most attractive varieties shown were Bing's Lamberts, Royal Annes and Black Republicans. These are all well known varieties and we have never seen them surpassed for size, color or flavor. Cherries as big as plums. It is said that we should not make two bites of a cherry, but many of these would require three. There were cherries of all kinds; white cherries and black cherries, choice varieties and seedlings, Mazzard seedlings for grafted stock, and in short the display covered the whole line of the cherry family.

A large number of premiums, chiefly silver cups of varying size and value, had been offered for the best specimens of different varieties, best packs in boxes, cartons, etc., and for all of these there were several contestants. The judges were Prof. C. I. Lewis, of the Oregon Agricultural College; C. A. Tonneson, Editor of the Northwest Horticulturist, of Tacoma; and G. R. Castner, of Hood River.

When a fellow gets to be boss—well, he'll do about as his boss did. Sometimes worse.

VALUE OF CULTIVATION.

The need of cultivation is in the first place, to improve the condition of the soil; particularly to render more open and porous, so that it can absorb more rainfall and permit the roots to grow with the least possible resistance. When you cultivate you increase the apparent volume of the soil; that is to say, if you dig a hole in the soil, as in preparing for a fence post, it is a very difficult matter to push back the soil that you take out. When you loosen the soil by plowing or harrowing you leave it in a much more bulky form and it absorbs much more of the rainfall, not only because it contains more volume of space for the water to occupy, but because the grains of soil being pushed apart there is actually more surface to hold on to the water. The effect of subsequent cultivation is to dry out the surface by exposing it to the air. We used to say that it was to break the capillary connection. You can not thus break the capillary connection in the soil, for when you put the soil back you have reestablished capillary connection; but this is what you do accomplish: The moist soil, so long as it is not actually wet, holds on to the moisture so tenaciously that it will not move up to any appreciable extent into the dry soil. If we have the surface soil dry, so that water will not come to the surface of the land, then the evaporation of water will be confined within the soil, and the vapor so formed will have to diffuse out through the dry layer, which is a slow process. The water will not be delivered at the surface of the soil where evaporation is most rapid. The loss of water by evaporation within the soil at a depth of three or four inches is exceedingly slow.

The later, then, that cultivations are continued, the better it will be for the crop of corn.—Prof. Milton Whitney in Journal of Agriculture.

FUNGUS AFFECTED PLUM TREES

We recently published an inquiry from a subscriber at Fresno regarding fungus-affected plum trees. On the same point Mr. Isaac writes:

The fungus is not shot-hole, although belonging to the same class of diseases. Nothing can be done at this time to cure it, as all possible damage has been done when the disease shows itself in this form. The only remedies must be of a preventive nature, and there is nothing better for fungus disease than Bordeaux mixture. Your correspondent states that he used this last winter without effect. In this case he probably did not use it in proper proportions or at the right season. The trees should be sprayed as soon as possible after they have shed their foliage in the fall, or even while it is falling, a second spraying just before the buds start in the spring will also assist for other forms of fungous troubles. Full strength Bordeaux should be used.

Wormwood, from which absinthe is extracted, is grown more extensively in Wisconsin than in any other part of this country, according to statistics. Absinthe is an oil having a very stimulative principle and is used in making liniments and in mixing beverages in saloons. Just a drop or two of the pure article in a glass of whiskey is said to put the drinker in a very hilarious condition, and the effect of continued use is accordingly disastrous. There is a secret in the growing of wormwood which is carefully guarded by growers, and the plant must be cultivated and harvested properly to produce a paying amount of oil.

With the Citrus Growers

GYPSUM.

AN orange grower asks for comparative value of gypsum and lime for correcting unhealthy soils. Soil conditions are not favorable when nitrification is retarded and this is always the case in acid soils. Most of our soils devoted to orange growing are alkaline, as is evidenced by the areas that have become excessively alkaline through drainage from the groves. Nitrification takes place more readily in slightly alkaline soils. Partially decomposed vegetable matter produces an undesirable condition of soil and is readily corrected by the use of carbonate of lime, potassium carbonate and sulphate of lime (gypsum). Quick lime retards the process of nitrification for awhile, but as soon as the slacking process is completed the effect is favorable. Wood ashes which contain carbonate of lime and (ash) have a beneficial effect. Gypsum, however, is the best. It is twice as effective as sodium sulphate of potash and eight times that of carbonate of lime.

Whatever element is used to promote nitrification, it must be effective to some depth below the surface, sunlight is known to be injurious to it. In the manufacture of nitrate, it is a well-known fact that absence of sunlight is necessary, though electric light has no effect. Quick lime is more effective on sour peat lands than is slacked lime.

PROTEIN.

Protein is a term used in agricultural chemistry to denote a group of elements in which nitrogen is an important part. The elements contained in protein are about 55 per cent carbon, 20 per cent oxygen, 16 per cent nitrogen, 7 per cent hydrogen, one per cent sulphur and less than one per cent phosphorus. Protein enters into all plant and animal life as a quality of unit or combination of the above named elements by itself. It has an important part in making up the value of a green-manuring crop as it is one of the sources of nitrogen. It is thought that protein is taken up directly and used as plant food, but not from the exterior of the plant. It is an important part of the seeds which give up this material directly to the new plant as it emerges from the seed cell. A parasitic plant takes it from its heart, etc. This latter is apparently closely related to the condition existing between the tubercles on lemons and the legumes themselves. It is almost certain that the protein contained in one plant cannot be used by a plant that grows and takes nourishment from the soil, until it has gone through the changes following decomposition. As a food for animals, it is quite different as it is used directly from the material used as food. It gives different results under different conditions. The firmness of Jersey butter, for instance, is attributed to the larger amount of protein contained in it.

A WRECKED HOME.

Mrs. Youngbride (sobbing)—That horrible Mrs. Falsetop has broken up my home.

Horried Friend—You don't mean to say she has enticed away your husband from you?

Mrs. Y.—No-o-o! It's worse than that! It's the cook.—Baltimore American.

MULCHING FRUIT TREES.

The following article, by a writer who has studied how to grow fruit with profit on rough land, may be read with interest by all who have rocky, hilly places on their farms which produce little or nothing if devoted to ordinary field crops, besides each year growing less productive from the washing away of the soil when cultivated. He says:

There is a great deal of rough land in every state that is especially well adapted to fruit growing, but owing to the nature of the ground it cannot well be cultivated. It is on such land that mulching is especially valuable. Mulching is nature's plan of growing trees. Just so long as the leaf crop in the fall is permitted to accumulate in the woods sufficiently to keep the grass down and to keep the ground moist the forest will reproduce itself.

A fruit tree may be planted on a ledge on a hillside and mulched with brush, leaves, straw, weeds or almost any trash that will rot down and hold the moisture, and that tree will grow luxuriantly and bear a crop of fruit every year. There are rough locations where both air drainage and water drainage may be secured which are valuable enough to pay handsomely for the extra labor in carrying mulch to the tree.

One thing should be remembered, that mulching draws the little feeding rootlets to the surface. The root habit of a mulched tree is different in this respect from a tree that has been cultivated from the time it was planted. For this reason it is necessary to keep the mulch growing year after year. Otherwise the roots that have formed at the surface will be destroyed if the ground is permitted to dry out, because the sun will burn the roots and kill them.

Mulching, to be successful, must be attended with a little hand cultivation near the trunk of the tree every spring. The ground is moist and soft and it may be dug up easily in March and April. Then as the season advances and the soil becomes dryer new mulching material must be added to take care of the tree during the dry time in the summer. The mulch should be placed around the tree early enough to catch the early rains and there should be enough of it to hold the moisture from every rain that falls, so that no water can run away. Apples require a great deal of moisture. To prevent field mice from girdling trees in winter the mulch must be pulled away in the fall and the tree hilled up with earth.—Colman's Rural.

THE FOOD VALUE OF FRUIT.

Fruit enters to a large extent, in some form or other, into the diet of every American family. There is no question but that, as a nation, we grow and consume more fruit per individual than any other nation. Yet the amount per capita is not as high as it should be. Some would have us use a fruit and nut diet entirely, but we are not quite prepared to agree to this. There is no question, however, that it should always form a goodly portion of each day's bill of fare.

The acids—malic, citric and others—are agreeable and refreshing at all seasons, and particularly so in the warm weather of the summer months. Sugar is generally present in considerable quantities, and in the

form in which it occurs in fruit, is easily digested. Salts of iron, lime and potash, though present only in small quantities, are very beneficial. Oils and fats are contained in most fruits only in very small quantities or not at all. There are two fruits at least, however, in which considerable fat is found. The avocado (Persea gratissima) sometimes analyzes as much as 17 per cent fat, and the olive has about the same fat composition. On the whole, fruits are rich in carbohydrates and lacking in protein. Hence they are valuable in providing energy to run the human engine, though of comparatively little value in building up the tissues. Nuts, on the other hand, are rich in protein.

Aside from their value for food, fruits have a very splendid effect on the digestive tract. They tone up the system and assist materially in enabling the stomach to digest other foods. Generally, they contain large amounts of water (about 80 per cent average) which, altogether with the large amount of crude fiber generally present may account in a large measure for their beneficial action in aiding digestion. Besides this, nearly all fruits have a distinct value as appetizers. This is particularly true of the pomelo or grapefruit, the orange, apple and pineapple.—Fruit and Nut Journal.

SENSIBLE SUGGESTIONS.

A correspondent of Home and Farm gives the following good advice:

If one is going into orcharding as a direct occupation and expects to devote his whole time to it, it is better to have a fine orchard than one of the ordinary kind. The former will not cost much more, and will prove far more profitable in the end. Of course trees of well-known marketable varieties should be planted, and good specimens from reliable dealers should be obtained. Then follow this with proper protection, which will include regular spraying. Attention must be given to overproduction, that is, do not let them bear heavily the first few years, or injury is most surely the re-

sult. Now, you will not want a larger orchard than you can properly care for, but you will want to care for the orchard after it is once set. Pluck off any fruit that will strain the branch of any tree. Keep your orchard up, that means set out young trees every season to take the place of any that have died or have become unprofitable from any cause. Do not permit your orchard to become ragged, but make every tree come up to the standard. This can easily be done if one has even but ordinary intelligence and will give the time to the work. A great many prefer to use only hoed crops at first in the orchard. Wheat, oats and such grain crops are bad for the trees. They take too much from the soil, but hoed crops, seeding the land to clover or cowpeas every few years will produce excellent results.

ALL ABOUT THE

Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling bud to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed—50,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

WAR WITH JAPAN?—NO.

We do not anticipate any war with Japan but nevertheless it may come. One thing is certain the American people are not encouraging war. There is an element in this country as well as in Japan, that smacks of Jingoism, and it is this element which is doing all the mischief at this time. Both here and in Japan politics is joining dark color to every suggestion of discord; every incident is magnified by a marplot press and truth is twisted into a lie. If these newspapers could be censured or suppressed in the interest of common sense it would be a good thing for the country.

One thing we do feel like saying, in this connection, and saying it might plainly, and it is this: The American people are tired of apologizing and weary of the effort to satisfy Japan of her kindly feeling toward her, and her people after they get into the United States. As the Des Moines (Iowa) Capital says:

"It is not the business of the Japanese government to follow every Japanese waiter around the American republic in order to see that some American waiter does not spill coffee on the Japanese apron."

But that is apparently what the Japs expect. Now it would seem that after the Japs come to this country they ought to take care of themselves, just as the German does and every other representative of a foreign power who comes to this country.

The American people have not taken any comfort by which they agree that no Jap shall be knocked down occasionally like every other man in a free country. The Japanese empire will have

all it can do to take care of the Japanese at home without governing them after they get into this country. "Every man in every land ought to be notified that when he comes to the United States, he takes his own risk," says the Des Moines Capital, which is the fact. "We cannot let Asiatics into this country and then give a bond that they shall always be treated better than the American is treated."

The truth is the Japanese are hungering and thirsting after social equality. Some years ago they sent a committee to Europe to investigate and report upon the social customs prevailing in the best lands. The committee reported in favor of the style of society governing the German court society and it was adopted. As the Japanese have progressed, their ambitions have advanced. And now they think they are as good as anybody. Especially has this opinion grown since the defeat of Russia by the Japanese. Our government is doing right in concentrating the navy in the Pacific ocean. Every preparation ought to be made in order that there may be no war. If our government is thoroughly prepared and continues to build battleships, we will have no battles to fight. President Roosevelt has evidently concluded that a show of force in the Pacific would be a good investment. Battleships and ships of war of all kinds should be either built or bought as rapidly as money can secure them and built on this coast if they can be. The American people do not want war. Japan has an idea that we are not prepared for war and when she finds out that we are there will be no trouble. But it is positively wicked for the press of the United States to be constantly betraying the plans of our government. The American government cannot purchase a barrel of powder without the fact being published. No doubt Japan is getting ready. Japan is saying nothing. Her people are too loyal to interfere with the plans of the emperor. Every Japanese man in the United States is a spy for his government. It is probable that the Japanese have plans and descriptions of every fort on American soil. The Jap is a sly person and you cannot tell what he is thinking about by what he is doing.

If there was as strong a sentiment of loyalty to this government, among its newspapers, as there exists among the Japanese for their empire, all the plans of the war office would not be heralded abroad to the detriment of the country. We need a stricter censorship of the American press.

WHITE FLY AGAIN.

W—dnp is elert if xse of setim rejdusqns v ger from the White Fly to orange growers in Southern California. Of course there is. Unless the colony now extant at Marysville and contiguous territory is exterminated we may look for trouble all over the State.

The Cultivator has discussed this topic so extensively, quoting the University bulletin on the subject, which treats of the character and depredations of the pest, that nothing more can be offered now.

The Cultivator was the FIRST agricultural journal in California to expose the danger we are in from the White Fly. A correspondent from Florida gave the warning note of alarm in these columns.

Jackrabbits, which for years have been the pest of farmers in Central and Eastern Oregon, are dying by thousands from some strange disease, which is now being investigated by the biological survey of the Department of Agriculture. Only a few years ago this district was famous for rabbit drives, when hundreds of the ranchers would gather and slaughter countless numbers of the little animals. Now, however, they are rapidly dying, and evidently will soon be exterminated. Some of these rabbits are being shipped to Australia in hope that the disease may infect the rabbits there and cause the death of great numbers of them.

Sample copies of the Cultivator are occasionally sent to non-subscribers with the hope that those who receive them will find enough of interest in the paper to warrant sending in \$1.00 for it. Not an issue of the paper which does not contain something of value—enough to pay for it a year. A subscriber from Marysville wrote, the other day: "I got information sufficient in one number of the Cultivator to repay my five years subscription." This correspondent had reference to the article on White Fly.

GREEN BUGS.

Continued from First Page

spécies. The first specimens sent to the Department at Washington came from an unknown locality. In 1884 they were reported again, from Maryland, and Professor Webster, then in Indiana, found them on some wheat which he was growing in an insectary for use in investigating another wheat pest. In 1890 they damaged the wheat in Oklahoma, Texas, Southern Kansas, Missouri, Illinois and Indiana, Kentucky and Tennessee. In 1900 the southwestern wheat district, especially, Texas, had a visitation. It seems quite well demonstrated that the insect is present practically all the time, but various checks to its increase keep it usually in abeyance. It feeds upon wheat, rye, oats, barley, corn, orchard grass, soft chess and many of the common grasses. In fields it has been found in great numbers on hawk-weed, *Heiracium longipilum*. It does its greatest injury in the spring season, following an open winter.

Some Friends of the Farmer.

Fortunately there are many enemies that prey upon the pest. One which has a somewhat questionable reputation as a benefactor is the snowy tree cricket, *Oecanthus niveus*, one of the Orthoptera. This is known to feed upon the aphides, but the female does some injury to the canes of raspberry and blackberry by her egg-laying habits. This insect is rather common, a very noisy singer and hearty feeder.

Another group of enemies is found in the lacewings, belonging to the order Neuroptera. These are delicate light green insects, one species having golden eyes, *Chrysopa oculata* Say. The eggs of this insect are oval and are placed singly at the extremity of a long hair-like stalk, usually in the midst of or near a colony of aphides. The larvae have long curved tubular mandibles, which enable them to suck the juices from the body of the aphid. The adults have a very unpleasant odor that seems not in keeping with the beautiful lacy opalescent wings and pale green body.

Often among the colonies of aphides will be seen small brown and green worm-like larvae busily feeding on the pests. These are the larvae of a group of Diptera known as Syrphus flies. The adults are most beautifully marked with brown and yellow and are among the handsomest flies known. They are very often mistaken for bees or wasps because of their resemblance, but their single pair of wings distinguishes them from the Hymenoptera, which have two pairs.

Another family which furnishes enemies to the aphides is one of the order Coleoptera, called coccinellids, or lady beetles. There are many genera of lady beetles, and all, except one, *Epilachma*, feed on other insects.

The Chief Destroyer of Green Bugs.

Last but not least in importance, though least in size, are the Hymenopterous parasites. There are several species of Hymenoptera that are parasitic on wheat-lice; but the one that has been so extensively used by the Kansas University this year in combating the green bug is one of the Braconidae, and is known by the generic name of *Lysiphlebus* (d). Those who have studied it find it is an undescribed species. It is often referred to as *Lysiphlebus tritic Ashm.*, and not unnaturally, for the rearing of that species from all three of the wheat-lice has been recorded by the Department of Agriculture at Washington, D. C. Just what the points of distinction are have not been reported. The methods of *Lysiphlebus* sp. are swift and unerring. When a healthy aphid is discovered the female takes a position over its body and thrusts its ovipositor or sting into the aphid's body, leaving an egg inside. The aphid usually raises its body from the normal position as if in pain, but soon begins feeding again. The work is done, however; for instead of bringing forth from three to seven young aphides daily, all the nourishment goes to feed the worm-like larva which has hatched within her body. This is shown in the figure of the wingless female (a, Fig. 1). The presence of the parasite gives a yellow spot on the abdomen very easily seen with a hand lens, and the outline of its body can be seen within the body of the aphid under a compound microscope. The aphid soon dies, and its body becomes distended and papery-looking. At the end of a week there is a wee round hole and a lively bee-like insect flying around looking for other aphides. The number of eggs laid by a single *Lysiphlebus* has not been determined; but a single female has been seen to sting a great many aphides. At any rate the aphid once parasitized stops reproducing and within a week ceases feeding, is dead, and has been replaced by a living parasite.

Southern California Northern California

AGRICULTURE.

"Dry ranching" is being practiced in Perris valley.

Onions are being shipped in carload lots from Hemet.

Anaheim is to ship two carloads of pudis to Klondike.

The hills south of Chino had a bad rush fire last week.

Over 1000 cows are required to furnish milk for the city of Pasadena.

Some claim the honey crop will not exceed one-half of that of two years ago.

L. S. Green, of San Jacinto, received \$150 per acre from potatoes this season.

Artesian wells near Oxnard are being capped to prevent waste of underground waters.

One thousand tons of alfalfa hay were sold by a Corona farmer to a Los Angeles dealer.

Beet farmers are busy polishing up the old plows and getting ready for the harvest of beets.

Glendora Farmers' Club held their annual picnic at Morgan's Cañon and had a pleasant and profitable time.

Coachella claims that its output of produce this year, will be more than five times as large as it was in 1906.

Long Beach city trustees are making a strike at unclean barnyards and poultry houses which are in the city limits.

The Colorado River got on another little rampage last week and showed rise, but nothing of a serious nature whatever.

The Santa Fé Railroad Co. is engaging in a thorough study of the eucalyptus, as a possible source of supply of ties in the future.

Threshing machines are working near Santa Ana, but are handicapped, as in many other sections in the State, by shortage of labor.

One train of twenty-two cars of live stock was recently received for "finishing off" by the California, Mexico Land & Cattle Co. at Calexico.

The lima bean crop is improving wonderfully. Growers near Oxnard, claim that last week has seen a great improvement in the appearance of the crop.

A beet grower near Oxnard has invented a new beet rack, a side dumping affair, which will economize very materially in the handling of sugar beets.

Downey is one of the largest shippers of milk into the Los Angeles market; in fact, most of the output in that section is absorbed by the city delivery.

Orange County will produce one hundred tons of honey this season—about one-half a crop. Prices expected are one cent higher than those of last year.

The Neuvo ranch, near San Bernardino, will make a gross return of between \$55,000 and \$60,000 this year. The income is from three items, barley, wheat and hay.

Oxnard Courier says that the honey crop season of that section is ending much earlier than anticipated. This was brought about by the early July warm weather. Flowers nearly all dried up and no more nectar to be had.

HORTICULTURE.

Whittier Valencias are practically all shipped.

La Habra valley is growing six hundred acres in tomatoes.

The Fay Fruit Co. are establishing a new packing house at Whittier.

Imperial valley anticipates the receipt of \$60,000 for its grape output.

Santa Ana is still making strenuous efforts to stop the stealing of oranges and other fruits.

The scrap between Santa Ana and Riverside, over the waters of the Santa Ana river, is still on.

J. C. Hume, of Valley Vista, near San Jacinto, received about \$500 per acre for his apricot crops.

Walnut crops this season are promised to be good unless something occurs unforeseen at this time.

The Coachella claims to be the first among the desert shippers and the latest producers of cantaloupes.

The first Bartlett pears in Los Angeles market commanded \$2.75 per box. They were from Vacaville.

Several hundred acres and an apiary were burned by a brush fire started by children, near Redlands, recently.

Santa Ana has a promise of a large olive oil company. It is claimed \$250,000 will be invested in the venture.

Orange County has a number of new celery fields this season and the output is expected to be fully as much as last year.

One apricot grower, at Ventura, who had some exceedingly large, fine apricots, received for his green fruit \$120 per ton.

The Whittier Citrus Association is offering a \$25 reward for arrest and conviction of persons stealing fruit from its members.

Orange growers are feeling good over the statement that cost of fruit-shipping boxes will be lower this year than for some time.

With Imperial valley grapes selling at 8 cents to 10 cents at Los Angeles, the vineyardists are wearing that smile that won't rub off.

Imperial valley is now sending carloads of grapes direct to the Eastern market. The hope is that they will bring from \$3 to \$4 per 100 lbs.

San Diego County claims an output of one thousand cars of lemons and that the income from their sale will be three-quarters of a million dollars.

Banning has never been quoted very extensively as a shipper of fruit, but last week she sent out one car of very fine plums for Texas consumption.

The Huntington Beach Canning Co. has put up over one thousand gallons of sauerkraut, and is at present employing 40 hands putting up more kraut.

Orange County has been drawn upon to the extent of \$500 as its share of expense of the National Irrigation Congress to be held at Sacramento in September.

Those districts of the Imperial valley which were deprived of water owing to washout of the flume across the New River, will soon receive irrigation water through the restored flumes. They have been without water for nearly a year.

AGRICULTURE.

Yolo County sugar beet crop promises to be extensive.

Petaluma grange held an interesting meeting last week.

The wheat raising industry is being encouraged in San Benito county.

Santa Rosa is a market place for much hay grown in Sonoma County.

Sonoma County is preparing for a raid on those premiums for county exhibits at the State Fair.

In some sections of the beet fields, the beets were injured by the hot wave of a couple of weeks ago.

The Sacramento Bee reports one potato grower who received a gross of \$600 per acre for his potato crop.

Vacaville Reporter says that Cordelia is being infested with coyotes which are causing much damage.

Examinations for position of forest ranger will be held at the supervisor's headquarters of Forest Reserves, July 23rd and 24th.

Thompson & Co., a Los Angeles butter commission firm, is securing interests in several creameries of the lower San Joaquin valley.

A severe forest fire started in Mt. Campbell district, Fresno County, in which some grain and much valuable pasture lands were burned over.

While moving a harvester from Corcoran, the big traction became stalled in the mud, and at the last report was still out of commission.

Between damage by flood in breaking of levees and by fire on water sheds and grain fields the Great Valley is having a hard time these days.

Tulare is hoping to have an agricultural fair, for which a company has been formed and incorporation papers will be filed as soon as possible.

The San Jose Mercury reports a number of cows dying on the Callahan ranch from anthrax. Vigorous measures have already been taken to stamp out the disease.

Grain growers in Solano County are vying with each other in large yields of grain. Some growers reporting 20 to 25 sacks per acre, while one ranch of 240 acres averages 33 sacks per acre.

The officers of the newly-formed Tulare County Agricultural Association are as follows: H. Hay, Pres.; W. A. Green, Vice-Pres.; V. F. Ingwersen, Sec. A fair will be held this fall.

The bad break of the levee in Kern County by which thousands of acres of rich farming land were inundated, was partially controlled by a new levee, which later gave away and the water is still spreading.

Yolo County commissioners turned down the application of the National Irrigation Congress for funds, and business men of that county are taking the matter up in private way to meet their proportion of the Irrigation Congress expenses.

Tulare county is concerned over the fact that many old half dead pear orchards continue to stand and spread blight to the few trees which are still kept in good growing condition. There seems to be no law which permits the destruction of these trees though they are of no value to anyone. The commission will enact such ordinance.

HORTICULTURE.

Watermelon shipping has begun at Dinuba.

Exeter is now shipping cantaloupes of fine quality.

Vacaville has shipped over 250 cars of green deciduous fruits.

Two new reclamation districts have been formed below Yuba city.

Maywood Packing Co. is installing olive oil-producing-machinery.

The Italian-Swiss colony, near Leemoore, is about to build a large new winery.

Exeter is shipping cantaloupes in large quantities, the first car going to Canada.

State Engineer, N. Ellery, inspected the river and levee of Sutter County last week.

A 14,000-acre tract of land is to be thrown open to settlement of small tracts near Turlock.

Winters cannery has opened on peaches on which it expects to have a long and successful run.

Winters cannery closed on apricots with the total pack of three hundred and forty tons of fine fruit.

Turlock irrigation district is preparing to vote for \$50,000 expense budget for the coming year.

It is estimated that 50,000 tons of dried prunes and 75,000 tons of raisins will be the output this year.

The Central California canneries plant, at Visalia, is now operating on peaches, principally Crawfords.

The first shipment of cantaloupes out of Turlock commanded \$5.00 per crate in San Francisco market.

Hanford Sentinel gives us the biggest one of all. It claims a gross return for one acre of apricots of \$1600.

San Jose claims that this year's output of prunes will be smaller than it has been for twenty years in that valley.

Tulare County Board of Trade is making a special appeal to the Secretary of Agriculture to modify his sulphur ruling.

Cherry orchards have proved valuable property this year some having brought a gross of nearly one thousand dollars per acre.

Reedley vineyardists are guessing as to their crops owing to the attacks of worms and grasshoppers which are very perplexing this season.

Levee District No. 9, in Sutter County, is improving levees of that district by raising to a greater height. Over 2000 cubic yards of dirt will be moved.

Tulare County Times promises that Tulare County will outdo all previous efforts at attempting to pull down the big premiums for exhibits at the State Fair.

Fruit growers of Tulare County are complaining of the carelessness of fruit peddlers, who go from orchard to orchard buying fruit often using infested boxes thus scattering pests from orchard to orchard.

The dried fruit market has been unsettled by the ruling of the Department of Agriculture as to the amount of sulphur permitted in dried fruit and at present no contracts are being closed by the buyers, but they are advising the growers to sulphur their fruits as in the past.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultry-men are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Fletcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

MORE ABOUT CHICKS.

CONTINUING our letters from poultry breeders in California, we publish this week articles from some specialty breeders of the northern and southern parts of the State.

We sincerely wish those just starting in the poultry business, and those who have had trouble raising their chicks would carefully study these letters as they are all from successful breeders.

Miss Carrington, of Haywards, near San Francisco, sends us a splendid article and encloses pictures of her colony houses, which are reproduced here, we are sorry these cuts are not better, that our readers might get a better idea of the houses. Many of

water vessels clean and full of fresh water and dry chick food—any good brand—scattered around, when I put the chicks in the brooders.

I am always very careful not to over crowd, placing about 40 in a one-hundred size brooder. This proportion I find gives best results. They are kept well supplied with water and chick food all the time, thus there is no danger of their getting over hungry and so overeating themselves. In a day or two I add to their diet, a mixture of bran, corn grit, ground wheat or ground grain, which I put in shallow pans. After the first week I keep increasing the size of the grain until they are eating the same rations as the rest of the flock.

Green Feed Too.

Green feed and meat in some form, are necessary after the first three or four days; whole wheat as soon as they can eat it, thus keeping their digestion strong and up to its work. I have seen chicks three months old that had never been given any whole wheat and they were dyspeptic, over-

the Cultivator family know of Miss Carrington as a breeder and exhibitor of White Leghorns, and those who attend the State Fair, at Sacramento, this fall will no doubt get to see her and her birds.

Miss Carrington's Letter.

The most important part in the raising of chicks is the hatching. However, strong the breeding stock, if the eggs are overheated, chilled, not cooled long enough, or cooled too much, or the incubator run in an ill-ventilated room, the chicks are bound to be a trial and a tribulation to the unfortunate attendant who tries to raise them, even with the finest brooders and the best foods. What I am going to say about raising chicks applies to good, strong fat chicks, from healthy stock, well hatched.

Don't Crowd.

Do not over crowd your incubator at hatching time. If I have a fine test and every likelihood of a full hatch, if possible, I divide the eggs about the sixteenth or seventeenth day, as when I am running a 390-egg machine and have one of my smaller ones empty, I place 100 or so of the eggs in the smaller incubator. Then from the time the eggs chip until the last strong chick is out I do not open the incubator. I then open the machine, remove the trays with the empty shell and all that have not hatched, open the ventilators and if the weather is very warm let the door remain a little way open, and leave the chicks happy and quiet for at least 36 hours.

Brooders All Ready.

My brooders I have all in readiness, having seen that the lamps are in good order, the floors clean and covered with sifted gravel, little

coddled looking weaklings that would succumb to the first illness or over eat themselves the first chance they got at whole grain.

Weaning.

I wean my chicks in the following manner: I have colony houses four feet by five feet with a tight felting lath floor, which slopes at an angle of about 30 degrees from the ground at the front to within twelve inches of the roof at the back; over this are placed perches. When the chicks are from six weeks to two months old—according to the season—they are put in these houses and a temporary run around the house.

I prefer to move them in the morning; in this way they get accustomed to their new quarters by sundown. They naturally hunt the dark at night and so all go on the lath floor and for the first night most of them will probably roost on it, but the second night will most likely find them all in nice rows on the perches, a joy to their owner's heart. In a few days the temporary run can be removed and they then have access to free range and are no more trouble until large enough to be placed in permanent roosting quarters.

I would say that these colony houses hold about 40 chicks each, but if you have enough houses it is better to put in about 30 chicks.—C. B. Carrington, Haywards.

Mr. Curtis, of Pasadena, sends us an article, the advice of which if followed will prove beneficial to any breeder. Mr. Curtis is successor to Captain Mitchell and follows practically the same plan in feed and care as did his predecessor.

Mr. Curtis' Way.

of the individual type heated by acetylene gas. Their floors are covered with sand to a depth of one-fourth to three-eighths of an inch. The first feed of mixed grains is scattered on the floor of the brooder just outside the hover. We use one of the proprietary mixtures, composed of hulled oats, cracked corn, rape, cracked rice, canary seed, a very little white grit and charcoal. A small water fountain is also placed in the brooder for the first day. After the first day the mixed grains are scattered in the cut oat or alfalfa hay that covers the floor of the brooder-house runs, and the water fountains placed outside the brooders. The proprietary mixture is their only feed—except grit, charcoal and clean beef scraps—for the first five days and thereafter cracked wheat is gradually added until at the end of three weeks the chicks are eating all cracked wheat. Whole wheat is then added to the cracked wheat in increasing ratio until at the end of the sixth week they are getting all whole wheat.

A Mash Feed.

The grain ration is fed three times daily until the tenth day when a slightly moistened mash, composed of bran, four parts, shorts and feed meal each, one part, one-half part meat meal and a teaspoon of salt to each quart of the mixture, all moistened with sweet or sour milk—preferably the latter. The mash is first fed on pie tins—three to the brooder—and afterwards in small troughs. It is left before the birds not longer than fifteen minutes, when the remainder—if any—is removed. Under no circumstances is this mash allowed to get into the sun as it quickly spoils, and must be fed immediately after mixing.

We have been experimenting with the above mash fed dry, but have abandoned the practice for the reason that more food was eaten or wasted to no advantage, either in the saving of time or increased growth or health of the chicks. If anything, the birds fed on the wet mash have done better.

Never Crowd.

As far as possible, we try to have never more than fifty chicks, or hens either, for that matter, in a brooder or flock. Crowding invariably results from not having the heat turned on in the brooders quickly enough (if it has been turned out during the day) before the chicks seek the warmth, or of running them too cool. Sometimes they will crowd from force of habit for no apparent reason whatever, the vice being generally started by some one chick who promptly has his neck wrung if discovered. This habit of huddling is a difficult one to break up and will follow the brood to the roosting stage when it once gets a fair start.

Teaching to Roost.

Inasmuch as we raise chicks by the thousand we are unable to afford them much personal instruction in the fine art of roosting, but where a flock of youngsters is slow in so doing we occasionally give them a lift or so to start them. The perches in the colony houses, where the chicks are quartered from the sixth to the twelfth week, are set not over ten inches from the floors and for the first two weeks clean straw to a depth of five or six inches covers the latter, and thereafter sand is used. The straw helps them to keep warm better than the cold sand.

CANADIAN IRRIGATION LAWS ARE PERFECT

THE Canadian Government looks after the interests of the farmer just as closely as he looks after his own affairs. When the settler goes to Canada he is assured that he will receive just treatment. The justice of the Canadian irrigation laws has attracted the attention of the states in the United States where irrigation is practiced.

There is no question but that irrigated farming is the most profitable farming but the settler should be certain that he is going to get a full and bountiful supply of water for his land and live stock before he depends upon irrigation.

The Canadian irrigation laws provide that no ditches shall be built where it is not an absolute certainty that they will be supplied with water, and plenty of water even during the very driest year. On the great Canadian Pacific irrigation tract near Calgary, Alberta, Canada, the lateral ditches are brought to the highest point on each farm—Thus the expense and work of constructing laterals does not fall upon the farmer, but he is ready to begin farming the moment he enters his land.

The expense of maintaining the irrigation works falls very lightly upon the farmer, too, because he is only required to pay 50 cents per acre per year on each acre of irrigated land for keeping up the ditches, which is much less than the actual expense of the work and this small payment is nothing when the increased yield of irrigated land is considered.

Thus everything is made easy for the settler—He spends no time getting ready to farm but begins at once when he arrives and his water rental is so slight that he hardly feels the expense.

Almost anything can be raised under irrigation in Alberta. Sugar beets produce enormously and every ton can be sold for \$5, this price is guaranteed, and it is a higher price than they usually bring in other sections. Alfalfa is one of the staple crops and it produces forage which makes stock raising a certain and sure profit bringer on a large scale.

Almost any of the cereal or root crops can be raised and the production is large—Good markets at the very door of the settler make farming conditions as nearly perfect as are to be found anywhere.

The man who settles on irrigated lands in Southern Alberta is not a pioneer—He has good neighbors and all advantages of modern civilization that are to be found on the farm anywhere.

We don't want you to come to Alberta unless you are satisfied that you can do better here than anywhere else. If you will send your name and address we will tell you how to see the country at the least possible expense and how to get a farm that will make you rich. In short, we will prove to you that Southern Alberta is the place you are looking for.

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

Manufactured by the

West Coast Stock Food Co.

818 San Fernando St. (Through to Alameda) Los Angeles, Cal.

MAIL YOUR ORDERS

at the cost of a one cent (1c) postal card direct to the factory if your dealer cannot supply you with A. C. W. EGG FOOD in 100-lb. sacks or A. C. W. Raw Materials. We will fill your order for one sack as cheerfully as for a 15-ton carload. Our Mail Order business extends into Nevada and Arizona.

We are not jobbers or dealers, but MANUFACTURERS. We manufacture our own Meat Meal, Bone Meal, Blood, Beef Scrap, etc. A Postal card will get our prices and our new 44-page book "Chicken Sense" all about the diseases of Poultry and their cures.

TO PREVENT HYDROPHOBIA.

We have but little faith in the power of any treatment to prevent this dreadful disease except that given at the Pasteur Institutes. But in case any one is bitten and it is impossible for them to go or be taken to such an institute, then some home treatment may be tried, for doctors are powerless to help.

A correspondent of the Jasper News tells of an old negro woman, two of whose children were bitten by one of the numerous dogs about the place, which dog had gone mad. It also bit several hogs. The hogs died of rabies, but the children escaped. When asked what she had done for the bitten children, the old woman said she hadn't done much except to rub the wounds with spirits of turpentine. If this is an effective remedy, the sooner it is known the better, for the application is a much cheaper means of prevention than a trip to the Pasteur Institute.—Florida

Absolute Cleanliness.

Incidentally we might add that all brooders, colony and hen houses are cleaned and sunned daily, sprayed with a lice-killing disinfectant weekly, and after every brood leaves them, scrubbed, sprayed and whitewashed. —Carl C. Curtis, Pasadena.

* * *

Ed. M. Burnell, Columbian Wyandotte breeder, who has favored the Cultivator before, writes:

Mr. Burnell's Way.

It is queer but true, that different poultrymen, feed, care and raise chickens successfully on entirely different lines. To illustrate, I have friend breeders who feed and house in ways that would end my flock and I presume they say the same of my methods, yet they raise their chickens. I may add I have over 1000 youngsters that look pretty good to me.

Until they are about six weeks old, I feed a dry mash of equal parts of bran and feed meal. I season this slightly with meat meal. They get lawn clippings for green food nearly every day and twice a week fresh ground bone. I find the bone a good builder, puts them on their feet and starts them off with that blocky condition I am after. Before them in separate dishes I keep finely ground granulated milk and they keep one busy filling the dish, for they like it. When about a month old I feed cracked wheat in the outside brooder runs.

How Large a Colony.

In each compartment of my sixteen-section brooder house, I keep about fifty; but right from the incubators I will put as many as 100 for two days. I find the first two nights critical and a slight chill will carry them off, in two or three days I divide them.

The hot water pipe is next to the hover opening; the return pipe in the back part of the hover; I find this makes an even distribution of heat through the hover. Cold makes chicks crowd and if they bunch I give them more heat and they soon scatter out. When the chicks are one month old I put them in the cold brooder.

Teaching to Roost.

When the chicks are put in the colony houses they find the roosts lying on the floor of the house. These I raise four inches from the floor in about three weeks. I do not believe in teaching them to roost too young, for it will give them a crooked breast bone and that hurts show specimens and market birds.

A Good Feeder.

I have made from five-gallon oil cans, a mash saving feeder, by cutting a strip of the tin out of the two opposite sides of the can about two inches wide; lay the can on the side and they feed from both sides, turn the tin in one-half inch, this keeps them from spilling the mash or grain out; these cans will hold a day's rations and it saves the three times a day feeding of growing stock.—E. M. Burnell, South Pasadena,

* * *

Harry McIntire, the Buff Cochinchina breeder of San Diego, sends us an article, while it is short, yet it is to the point. His rule of not giving water until the fourth day is new to us, as we always give water when chicks are 24 hours old, and have had good success. Yet, no doubt, the plan is all right for Mr. McIntire raises some

of the best Buffs produced west of the Rocky Mountains.

Mr. McIntire's Way.

My chicks are all kept in the nursery of incubator until the hatch is over, then removed to brooder where they receive chick feed (as prepared by poultry supply house) on their third day—with no water until the day following—I feed them but a small allowance, but feed it four times daily. Chopped green food is given them plenty; as they grow older, cracked wheat and cracked corn is mixed with the chick feed, until it gradually is substituted entirely for the chick food.

Weaning.

Less heat is gradually given them until shut off entirely and then the brooder top is lifted off and after a week or so they are then put into open (on south side) sheds—in colonies of about twenty, and when half grown perches are given them and a few older fowls put with them, soon teach them to take to the roost.

Small Colonies.

The smaller the colony the less they crowd and sweat at night—night sweating brings on colds and roup. For several years I had roup to contend with in growing youngsters and now never have it, as with no night crowding there is nothing to bring it on. I am breeding Buff Cochins and White Wyandottes and they are both strongly constituted—and I never try to raise a weakly, slow growing chick—but weed them out.—Harry McIntire, San Diego.

* * *

AROUND THE YARDS.

Success comes only to him who sees an opportunity and grasps it.

* * *

Every neglected duty makes success harder.

* * *

Many who try to make the breeding of fancy or exhibition poultry profitable, fail because they are not, and never can be, fanciers

* * *

Poultry simply for the sake of keeping it is not what we want, but poultry that will bring "grist to the mill."

* * *

The comb is a good indicator of the health of your flock.

* * *

If you feed soft food, season with a little salt.

* * *

Geese are just as profitable as turkeys, and are a great deal easier to raise.

* * *

Two weeks is long enough to fatten a fowl if fed properly.

* * *

Hens that are given a variety of food and are not overfat will lay eggs that should hatch, if the male is active and vigorous. Fresh meat gives vigor to laying hens and if more meat and less corn is fed the hens will more than pay for the difference in price of the meat in the increased number of eggs laid.

* * *

Two Irishmen driving through the country noticed that many of the barns had weathervanes in the shape of huge roosters.

"Pat," said one of the men to the other, "can you tell me why they always have a rooster and never a hen on the top iv thim barns?"

"Sure," replied Pat, "an'it must be because av the difficulty they'd have in collecting the eggs."

General Agriculture

LUPINES.

THE lupine is ordinarily considered a harmless plant, but on the contrary, it is one of the most dangerous. It has a blue flower and it is often mistaken for, and by many called, loco weed.

The lupines, like the loco weed, belong to the pulse or clover family, and there is quite a striking resemblance between them. They are commonly seen growing by the roadside, in the canyons of the mountains, and are generally all over the Eastern plains. The essential points of difference to the casual observer, are that the lupines grow higher, the flower is more brilliant and the leaflets radiate from the end of the leaf stock, forming a circle around the stem. The plant is commonly called the wild bean, or wild pea. The pod forms about the first of June, and in August the fruit falls off and the plant continues green after the grass has dried up. The well-known Indian turnip has a leaf resembling the lupines, which can be told by its large, starchy tuber root.

Will Poison.

The lupines are relished by horses and cattle and especially by sheep. The plant, under ordinary conditions, and when not in seed, constitutes one of the most valuable forage plants. In Montana it has become so abundant that thousands of acres are cut every year for hay. It is rapidly increasing in this State, and its danger, as well as its value, should be generally known. When eaten by cattle or sheep when wet during a storm, it will sometimes produce a serious bloat, much the same as alfalfa, and in addition may, under these circumstances, produce more or less poisoning. The principal part of the plant which is dangerous is known as "lupinotocin," and it is found mostly in the seeds. The plants, if cut before going to seed, or after the seed pods have broken open and the seeds dropped to the ground, makes a valuable forage crop, and can be fed to all species of animals with perfect safety; but if the seeds are eaten either in the growing plant or in the hay, a most violent poison is sure to result. If hungry animals are being driven across a country infested with this plant, they will grab at tops of the plants and naturally get many of the pods, and it is under these conditions that the worst poisoning usually happens. There are reported, however, some serious cases of poisoning from feeding lupine hay, especially among sheep.

Symptoms.

The symptoms of lupine poisoning are, first, mental excitement, which is characteristic of sheep. They will run in different directions, colliding with one another and with various objects. This is followed by convulsions, falling fits and final collapse, in some respects, similar to those seen in strychnine poisoning. In chronic poisoning, which is seen more in horses, it is known by the name "lupinosis." The symptoms are those of fatty degeneration of the liver and kidneys and sometimes of the heart, loss of appetite, fever and the visible mucous membranes have a yellowish color. These phenomena are accompanied by dullness, excitability, stiffness of the jaws, constipation, loss of weight and occasional paralysis. In the course of time the

animal dies from pronounced emaciation. The similarity of the symptoms in this condition to those seen in the so-called "no name disease" of horses in this State and Nebraska, has made it advisable to make a thorough investigation of this plant in connection with this disease.

"Lupinosis" in sheep in the chronic form, is always accompanied by a yellow appearance of the skin, as well as of the visible mucous membrane.

I find that many of the mysterious cases of poisoning of domesticated animals from widely different sections of the State, and which to the owner is invariably surrounded by mystery or results in the accusing of a neighbor as having wilfully poisoned the animal, is in reality, a poisoning from this plant, which is found growing abundantly in the pastures, in the meadows and by the roadside, and which has always been considered perfectly harmless.

Antidote.

We have, at the present time, no knowledge of a reliable antidote for lupine poison. The treatment that promises the most is permanganate of potash, which has been found such a valuable antidote for poisoning by larkspur. The directions for giving this treatment will bear repeating, because it is a most valuable antidote for poisoning by a number of our alkaloids. It has been positively proved that it will save most animals poisoned from larkspur. It is the antidote used by physicians in case of poisoning from morphine and other dangerous alkaloids in the human. For cattle and horses, 40 grains of permanganate of potash and an equal quantity of sulphate of aluminum thoroughly dissolved in a quart of water. This dose is for fully matured animals. In smaller animals the dose should be given in proportion to weight. When animals are badly frenzied from eating lupine, it is found that hypodermic injections of morphine, in three grain doses for large animals, or drenching with a solution of choral hydrate, say an ounce and a half dissolved in at least a pint of water.

It is well for farmers and stockmen to become familiar with this plant and its symptoms in treatment, as it may be the means of saving some valuable animals.—Geo. H. Glover of Colorado Agricultural College.

Thousands of people will suffer loss of money and endure great privations as a result of the extravagant statements published about what can be accomplished by the adoption of the Campbell system of dry-land farming. We have been surfeited for years with agricultural romance from writers who write about such matters of which they know nothing. Settlers have been learning for years how to raise crops and make farming pay in districts where it was not possible to do this by the methods followed in regions of abundant rainfall, but there is no justification for the absurd statements which are leading thousands of people into trouble.

"If you find yourself a-feelin' that you'd like to pick a fight, if you find you're not a-sleepin', an' you hardly eat a bite, if your head just keeps a-throbbin' at a mile-a-minute rate, you have got it; quit your workin' an' begin a diggin' bait."

You can have a cool drink any moment from

APPELL'S SOUTH AFRICAN WATER BAG

(PATENT APPLIED FOR)

It keeps water cool 48 hours or longer; in sun or shade; no ice; light and convenient to carry. It is a welcome convenience to threshing crews, farmers, stockmen, rangers, millmen, timbermen, railroad men, teamsters, boatmen, travelers, prospectors, surveyors, sportsmen, miners and everyone exposed to dry, warm weather away from good water supply. Can be hung under a wagon, on a vehicle, on a tree or laid on the ground. Will keep water cool under all conditions, provided the bag is exposed to the air. Satisfaction guaranteed or money back.

Loss of Valuable Cow.

In a letter direct to Mrs. Sherman, the writer says: "We always feel you to be a 'friend in need' and it is a great help to have you talk to us now every week in the 'Cultivator.'" Every word is read and "digested."

A neighbor of ours has just lost a valuable Jersey cow in calving. The cow was small, the calf quite large and he says the calf bag (the uterus?) came away. He tried to replace it, washing it off with water, as it lay in the dirt, but it slipped out again. He went for a veterinary surgeon, who roughly forced it back without washing it, the surgeon then put a horse collar on to the cow and fastened a bandage on to that, but a hemorrhage came on and in a short time the cow was dead.

You have had so much experience with cows that I feel sure similar cases must have come under your observation. Will you in your next article write on this subject? Also will you tell us if there is any danger of the other cows 'catching' it?"—R.

Give the cow an opiate to stop straining. A dose of two drams of opium in a little flaxseed or bran gruel is always to be depended on to make her quiet. Examine carefully, removing any portions of the after-birth. If the uterus is bleeding, bathing in a little cool water will check the flow. Thoroughly cleanse the parts in warm water, place a clean cloth under it and have two assistants hold it up. Then place the cow with her front feet in a hole in the ground. Cleanse the hands with good soap and water, finish with a rinsing of carbolic acid water or some other disinfectant. While this cannot be another than a septic operation still there is no use in making it any worse than it already is by dirty handling. Take the mass firmly, but gently in hand close up to where it leaves the body and press it closed hand into the body and put slowly back. Follow it with the the hand clear up, gently pressing out the folds to place. This will take a few minutes time, if strong contractions are not felt take a small piece of ice in the hand; this also serves to stop blood. In cases where the blood is flowing severely inject hot vinegar; this is an old, but almost certain remedy. Withdraw the hand carefully and have a large pad of absorbant cotton or of soft cloth soaked in carbolic acid water ready and have an attendant hold it in place while the truss is being made. A piece of leather six to eight inches long and four inches wide having two holes pierced in each end. If the leather is not at hand a stiff piece of oil cloth will do, or even a bit of new shingle. Put a horse collar upside down on the cow's neck and then tie to it at the top a piece of strong muslin, ten inches wide; bring this down the center of the cow's back, splitting it at the tail and tying each end into the holes on the top of the leather. Place the leather over the cotton pad. Take two three-inch strips of the muslin and tie to the bottom holes in the leather and pass one on each side of the cow's udder, bringing it forward

and up to the center of the back, there pin it securely into the wider piece of muslin. Then make a wide girth of the muslin and fasten around the cow's body, securing it firmly to the back piece. Take another piece from this girth between the front legs to the horse collar and tie it there. Keep the cow quiet and give her light feeds of bran with a small amount of long hay. Avoid heating foods or large quantities of green stuff. See that she has plenty of fresh water. Watch the truss and keep it firm for about two weeks. See that it does not chafe. Change the absorbant cotton pad daily or twice a day if there is need. Cows rarely die from this trouble if handled with reasonable care, but it becomes troublesome, as it is apt to recur at each freshening. Therefore, I should fatten the cow off for beef at the end of her milking period. No, it is not contagious.

Cooked Barley for Hogs.

Kindly give me through your columns the relative value of cooked or steamed barley over raw as a hog-fattening commodity.

Would also like the same information as to Indian, Kafir and Egyptian corn.—J. W. H.

The relative value of cooking feeds and feeding raw to hogs has been thoroughly tested at the various Experiment Stations and while there is an increased digestion it has not been found profitable enough to pay for labor and fuel used. In cold countries it adds more to the value than in countries like California. I have fed cooked barley, corn and bran with potato raisins and waste dried fruit, to one lot of pigs and another on the other ranch were fed the same mixture, or wet with cold water. The difference was triflingly in favor of the cooked feed, but the extra pounds on those porkers cost about a dollar a pound, so it proved not economical where it was necessary to count a man's wages for the time of cooking.

Pope Leo.

Is, or was there a stallion named "Pope Leo?" What breed, and a brief history of the horse.—M.

Will you kindly tell us the breed of the horse or at least whether he was draft stock or not? A question like this savors of a bet to be settled rather than a desire for exact information. If you have ever seen any of the get of this horse a reasonable guess could be made as to his breeding. Then it would be possible to apply to a Breeders' Association for his pedigree. As it is it would necessitate letters to many papers and some waiting to find out. Then the horse may have been a good cross-bred animal, but never a recorded one; one of the best horses ever around here, as far as crossing on all kinds of mares, was old Noel; he had five crosses of Percheron on thoroughbred and has of course never registered as a Percheron, though he produced splendid colts. If you believe there was such a horse, inquire of the old men around the livery stable in the neighborhood where the horse was located and the information will be gleaned at least as to what breed he represents.

Losing Milk.

Last month my cow slipped her calf at three months along. Since then she has trouble holding her milk; late in the day it begins to drop from her bag. Is there a remedy for the dropping of the milk?—T. E.

The usual remedy for dropping of milk is to slip on a rubber band like those used for holding together papers, over the lower end of the teat. It should be tight enough to hold back the milk, but not tight enough to cause strangulation. This is after all not a very satisfactory remedy but seems to be the approved one. The loss of calf did not produce the trouble; it usually comes from a relaxation of the muscle that closes the milk duct, as the result of an injury.

Black Combs.

Mrs. A. of Hollywood, wishes to know what makes her White Leghorn combs turn black; also why yolks of eggs are light yellow.

The trouble with a fowl when comb turns black is indigestion or some ailment caused by sluggish movement of blood; this may be caused by a number of things. It may be too rich food and not enough exercise, or lack of grit. Unless we know more of the conditions, feed and treatment, we can't give cause. Try giving plenty of green food; feed less grain, give plenty of grit and if possible more exercise and see if the color of comb is not improved.

The light yolks don't mean anything so far as eggs are concerned, but often the feed influences the color of yolk.

Feather Eating.

Will you please tell me whether there is any way to stop hens (S. C. White Leghorns) from eating each others feathers? I have quite a number in one of my yards that got the habit so that many of them are al-

most bare around tail and vent.—J. R. H., Arroyo Grande, Cal.

Your birds have a habit that once acquired is hard to break and is very

often caused by not having enough meat ration. We would suggest feeding few that contains feather pickers quite a heavy meat ration or green bone—being careful not to feed enough to cause bowel trouble. If this does not break them remove the ones that have acquired the habit to a yard by themselves or send them to the butcher as the trouble will spread through your entire flock.

Lawn Clippings.

I would be glad to know if lawn "cuttings" soaked in water and kept for few days is good food for hens, as it gets a strong smell after the second day, and although the hens eat it and it does not seem to do them any harm I would like to be sure about it.—R. J. S.

We don't believe lawn cuttings fed to fowls after they have become sour will do your birds any good. You will have to feed a great deal of charcoal in order to absorb the gases. Lawn cuttings, if fed fresh, is one of the best kind of green foods, but we never feed it after it gets stale. Some dry the clippings, then soak up and feed as needed.

INTESTINAL WORMS.

The following from a subscriber in regard to intestinal worms, only shows one of the many troubles with which poultrymen have to contend. While the trouble is very annoying and often causes loss of both old and young stock, yet it is a subject upon which very little has been written, but with hygienic preventive measures and by using simple methods we can keep our flocks reasonably free from them.

"For nearly a year I have had no end of trouble with common intestinal worms in my hens. Have had the heads cut off of several, but ex-

perimented on one and saved her life, but don't know that it paid. The first I noticed wrong with her she could not use the muscle of her eyelid; then the toes of her foot on that side turned under when she walked. Now I knew what was the matter and fed her on garlic straight for two days when she refused to eat more. Then I gave her twenty drops of turpentine in a tea spoon of sweet oil and two days later repeated the dose. For two or three days she refused to eat; passed worms and got better but is still weak. Another good layer lost the use of her leg and I gave her three doses of twenty drops each of turpentine; then she dropped three worms and died and I did not blame her.

"Tell me how to save my young stock from getting the disease. They all have free range. Will thirty drops of turpentine in each quart of drinking water injure four-months-old pullets? I have heard that onions will prevent worms. If so, in what quantities and how often should they be fed?"

Turpentine given, as the letter states, will free the fowl from worms, but we believe to give a hen three doses of 20 drops each is too much; never give over two doses of 20 drops in a teaspoon of sweet oil. Then follow with a physic of one teaspoonful of castor oil.

In regard to 30 drops of turpentine to each quart of water for half-grown pullets as a preventive for worms, some authorities say that this will not keep the flock free from worms, but will cure those that have them; however, we think that 30 drops to a quart of water is a little strong and birds will get very thirsty before they will drink the water con-

taining so much turpentine. We would recommend one teaspoon of sulphur for 12 hens fed in a mash, also use sanitary methods, see if you can't get rid of the trouble in this way:

If possible move your yards to fresh ground and remove the afflicted ones from the flock; clean the droppings from the houses each day and destroy any parasites or their eggs which may be in them, with quick lime or by burning. As long as the sick fowls remain in the flock and the well ones are allowed to scratch and pick at the droppings, you will continue to have trouble. We don't believe onions or garlic, even though fed liberally, will prevent the trouble.

THE FARM MORE ATTRACTIVE.

In the past few years there has been less tendency of changes from farm to town life than formerly. There are several reasons why this is so. One is that agriculture has come to be better understood as appealing to the best thought and higher qualities of scientific research. The agricultural colleges of the several states have contributed their share in this belief, as for years past the graduates of these colleges have gone back to the farm, and are found in every section of the country where their work is being appreciated. Such quickened intelligent work begets a love for farm life.

Another factor entering into this question was the establishing of telephone systems of all the farms of the country, bringing farm and town together in quicker knowledge of what is transpiring in the world, and especially in better business and social relations. The building of electric railways over the country is another important matter destroying distance between farm and market centers, and

bringing all classes into social relations. The rural free delivery of the mails is adding greatly to these better conditions. Out of all these things have come better prices for farm products, readier sale and greater demand for them. The old methods of barter have not only disappeared but are almost forgotten, and farm products command cash. The improved methods of cultivation and transportation have leveled the distinctions which once prevailed to some extent, and have made farm and town unite in progress and common interest, and brought about in some sections almost as great a tendency from town to country as exists from country to town.

JOHNSON GRASS.

The results in investigations in eradicating Johnson grass, are given in Farmers' Bulletin 279, U. S. Dept. Agriculture, in which the results of investigations on the eradication of Johnson grass are reported and discussed.

It appears that the best method is to turn the land into meadow or pasture, keeping the grass closely cropped, either by grazing or mowing, for one or more seasons. The grass should never be allowed to stand after blossoming. After the sod has remained undisturbed for a year shallow plowing, with subsequent cultivation, is recommended. Running an ordinary turning plow from three to four inches deep will generally turn up all the root stock, and if the land is then planted to a cultivated crop and given good cultivation the Johnson grass may be eradicated. Any shoots missed by the cultivator should be removed by hand before heading out.

Studebaker Wagons

No one ever claimed to build a better wagon than the Studebaker.

Slope shoulder spokes and chemically treated hubs make wheels that last.

From tip of tongue to tail of reach you cannot discern one single, solitary joint or stick of timber in a Studebaker Wagon that is suffering under the minutest stretch or strain.

Our stock is complete. We can furnish wagons of suitable size for any work.

A LOST CHORD.

Seated one day at the organ,
I was weary and ill at ease,
And my fingers wandered idly
Over the noisy keys.
I do not know what I was playing,
Or what I was dreaming then;
But I struck one chord of music,
Like the sound of a great Amen.
It flooded the crimson twilight,
Like the close of an Angel's Psalm,
And it lay on my fevered spirit
With a touch of infinite calm.
It quieted pain and sorrow,
Like love overcoming strife;
It seemed the harmonious echo
From our discordant life.
It linked all perplexed meanings
Into one perfect peace,
And trembled away into silence
As if it were loth to cease.
I have sought, but I seek it vainly,
That one lost chord divine,
Which came from the soul of the organ,
And entered into mine.
It may be that Death's bright angel
Will speak in that chord again,
It may be that only in Heaven
I shall hear that grand Amen.
—Adelaide Anne Proctor.

THE AMATEUR UMBRELLA MENDER.

GILBERT REYNOLDS glanced at his reflection in the mirror and laughed. He was a tall fellow, with bushy brown hair, a Roman nose and a very determined-looking mouth and chin. Just now he had buttoned himself up in an old duster and pulled a soft felt hat down over his eyes and with his brother-in-law's umbrella and his sister Amy's parasol under one arm and his own umbrella under the other, he cut very much the same figure as the man who went the round of the city crying: "Umbrellas to mend."

It was just six o'clock and beginning to grow dark when Gilbert left the office. Some gray clouds were scurrying across the autumn sky and a few chilly raindrops splashed on the pavement.

Gilbert started briskly in the direction of home, busy with his own thoughts, until his attention was attracted by a sudden tap on one of the windows of an old-fashioned dwelling house which he passed every day.

Looking up, he saw to his astonishment a very pretty girl beckoning to him. Her hair was fair and curled about her forehead and neck in loose ringlets; and a roguish-looking dimple kept guard at the corner of her smiling mouth.

Now Gilbert was too gallant a young fellow to pass on unheeding while a pretty girl like that beckoned to him. He paused, smiled and would have raised his hat had he not been, as I have already told you, burdened with umbrellas.

The young girl threw up the window and called to him in a sweet, clear voice:

"Wait a minute, please! I have an umbrella for you!"

And immediately she vanished.

Gilbert stood for an instant quite dumfounded, and then, as the ludicrousness of the affair rushed over him, he burst into a little laugh of amusement, calming himself, however, when the front door opened.

She had mistaken him for the umbrella man.

Gilbert was young, and of course admired a pretty girl; so he at once decided to accept the situation, as it promised further opportunity of seeing his charming creature.

So, when she appeared with a

black silk umbrella in her hands, he turned to her with grave attention.

"The handle is broken, you see," she said, "and the spring," partially opening the umbrella and shaking out the dark folds with her fair little hands. "I have been watching for you all day," she added naively; and Gilbert's heart leaped into his throat.

How nice it must be to have that dear little thing watching for a fellow every day!

The young lady turned a little anxious look upon him with a pair of wide, blue eyes.

"Do you suppose it can be mended?" she asked confidently.

"Oh! yes, indeed!" was Gilbert's reckless answer, although he knew no more about it than she did.

"And when can I have it?" "Tomorrow," said Gilbert, promptly, congratulating himself on the prospect.

"So soon. Very well." She nodded her bright little head at him and ran up the steps while Gilbert passed on with an additional umbrella in his hand and visions of golden curls, blue eyes and rosy lips mingling in delightful confusion in his brain.

That evening he sat down to supper with a dreamy and abstracted air. His sister tried to rally him.

"Gil," she said, "your future wife is in town."

"Eh—what?" said Gilbert.

"The girl whom I have decided upon for my sister-in-law," pursued Amy, laughingly. "She was in the same class as I at school. The family have just moved to town and next week you must call with me."

"Well, I'll see about it," said Gilbert dreamily as he put a teaspoonful of salt into his second cup of coffee. Amy looked at him with wide-eyed amazement.

"What has come over the boy?" she ejaculated. "Gil, dear," leaning across the table, "you have not been gambling or robbing the bank, have you?"

Gilbert shook his head as a reply.

The next morning on his way to the city he rang the bell of the house which contained his unknown beauty.

The young lady opened the door.

"I shall not be able to return your umbrella to-day," he explained, glibly. "It will take longer to repair it than I expected. To-morrow, without fail, I will bring it."

(Gilbert had left the umbrella with an old man, whose sole employment consisted in mending chairs, umbrellas and musical instruments.)

"Oh! very well," said the little lady, as she cast a smiling look at the clear sky and another at the young man, who, in his neat business suit, presented a different aspect from the rather rough-looking figure of the previous evening. "There is no particular hurry about it, so long as the weather is fine."

And then, as he went striding away, she looked after him.

"What a very respectable-looking person he is for one in his position," she murmured.

The next day Gilbert was prompt with the umbrella, and the young lady as prompt with her purse. She looked her property over with a little nod of satisfaction.

"That looks very well," she said. "And now, how much am I to pay you?"

Gilbert hesitated, faltered and flushed and finally stammered like the man whom Dickens has made famous:

"It's of no consequence."

But the amused surprise in the girl's face brought him to his senses, and he coolly named the price which he had that morning paid to the old man. It is safe to say that the silver coin which passed from the girl's hand into his was out sacredly away; for by this time Gilbert was very far gone. The bright eyes and sweet voice had quite bewitched him.

On the following week Amy insisted upon Gilbert calling with her on the young lady whom she declared he should marry.

"She is the dearest girl in the world," said Amy, enthusiastically, "and the very prettiest. You will be sure to like her."

"Oh! yes, I know," drawled Gilbert; "a tall, dashing girl, with flashing black eyes and an awful temper. Of course, I must go with you, sis; but don't build any matrimonial air-castles, for my heart is no longer in my own keeping."

And he straightened his tie with a sentimental sigh, and took his silk hat in one neatly-gloved hand.

Amy looked at him sharply as they started off together. Was her pet brother really in love with some strange girl?

"What a goose you are, Gil!" she said, half provoked. "Claire doesn't answer to your description at all—wait until you see her."

Great was Gilbert's surprise when his sister led him up the steps of the identical house which contained his unknown divinity, and great was the unknown divinity's surprise when her old friend, Mrs. Ross, introduced as her brother the tall young man who had taken her umbrella to mend!

Gil smiled into the wide, blue eyes of Miss Claire Edmonds and bowed low before her, while she, after one swift, bewildered glance, burst into a merry peal of laughter in which she was joined by Gilbert.

"Why, it's the umbrella man!" she exclaimed, and Amy looked on in blank amazement, wondering if her brother and her friend had taken leave of their senses.

Explanations followed. Of course my readers may imagine that Gilbert's first call was not his last one and that Amy's matrimonial air-castles were built of substantial material, for Gilbert Reynolds and the pretty, fair-haired girl are happy when sharing one umbrella and they are soon to be married.—Stanley Hammond in Farmer and Stock Grower.

A suggestion to travelers: In packing trunks there often comes the final hour of desperation, when, after last calls, muddy boots go in on top of a jet bonnet and the last delay washing on top of that; or perhaps unread papers with some friend's speech are sacrificed to wrap up these shoes. To avoid this dilemma, make several pairs of bags of light-weight washable stuff (pieces of summer dresses, percale, lawn, etc., may be used); make but one pair of each color. Put each shoe or slipper with its own bag, not a pair together, and they will rub and will not pack to advantage. In searching for them, the color of the bags show which are mates.—Woman's Home Companion

A good many people have the courage of other people's convictions.

RECIPES.

Baked Fish.

Bass and pike are large fish, therefore are suitable for baking. Cleanse and fill with stuffing, sew the fish up, spread thickly with butter, dredge with flour. Add one teacup of boiling water to some hot butter in a baking pan, lay the fish in and bake for one hour, basting often. Remove the fish when done, add browned flour and butter to the gravy, cook a few minutes, then pour around the fish. Garnish with thinly sliced lemon and sprigs of parsley.

Lettuce in Hot Weather.

Cook a quart of canned tomatoes, drain and season. While hot add a half box of gelatine dissolved in a cup of cold water, stir well until the gelatine is all dissolved. Pour into shallow dishes or small molds. Serve on individual plates in leaves of lettuce with chopped celery and salad dressing.

Scrambled Eggs With Bread.

Cut a slice or two of bread into dice and put them in a frying pan with some butter; when they are brown eat up a few eggs with a little salt and turn them into the pan, stir up all together.

Baked Mutton Chops.

Mutton chops may be cooked in a broiling-pan in the oven instead of broiling or frying and with a tomato sauce this makes a fine dish. Lay the chops in the pan and season with salt and pepper. Make a sauce by cooking together two tablespoons of butter and two of flour until smooth and slightly browned; mix in a quart of fresh or canned tomatoes, also a saving of onion and two or three cloves. Stir and cook the whole for ten minutes, then season with salt and pepper and strain it over the chops. Cook in a hot oven for about thirty minutes. The same sauce is good with a rather dry fish, such as cod or haddock.

Potato Fritters.

Bake eight large potatoes in their skins until tender scoop out the insides and mash; add to them half a pint of milk with one egg beaten in, a tablespoon of grated cheese, a small piece of butter, and salt, pepper and nutmeg to taste. Stir to a perfectly smooth batter and fry as ordinary fritters. Drain on blotting or glazed paper and serve very hot.

THE BEAUTIFUL HOME.

I never saw a garment too fine for a man or maid; there never was a chair too good for a cobbler or a cooper or a table too good for a house too small to shelter the human head. Elegance fits man. But do not we value these tools a little more than they are worth and sometimes mortgage our house for the mahogany we bring into it? I had rather eat my dinner from the head of a barrel or dress after the fashion of John the Baptist in the wilderness or sit on a block of my life than consume all myself before I got to a home and take so much pains with the outside that the inside was as hollow as an empty nut. Beauty is a great thing, but the beauty of garment, house and furniture are tawdry ornaments compared with domestic love. All the elegance the world will not make a home, and I would give more for a spoonful of real hearty love than for whole loads of furniture and all the gorgeousness the world can gather.

—Oliver Wendell Holmes.

HOMELY HINTS.

Cheap kerosene used in cleaning windows will make them smeary.

Dish towels should be washed and hung in the sun to dry after each using.

If suet which is to be chopped is first sprinkled with ground rice it will chop more easily.

Dried and hardened lemons will become quite soft again if allowed to soak in cold water for a time.

Stains on knife handles may generally be removed by rubbing them for a few moments with a damp cloth dipped in kitchen salt.

To clean zinc, mix whiting with ammonia into a smooth paste and apply it to the zinc with a soft wollen cloth. Let the whiting dry and then rub it off with a piece of flannel.

To remove oil stains from wood make a stiff paste of pipeclay and water and spread it on the stains. Leave till the next day, then remove the pipeclay, when the stains will have disappeared.

A whisk broom cut so that it tapers to a point at one side is convenient for brushing down the stairs. An old whisk broom which is partly worn out will do for this purpose just as well as a new one.

Never wear new stockings till you have had them washed, for the washing somewhat shrinks and toughens the fibre of the wool and they will not be so liable to go into holes as if worn directly they were bought.

Ordinary washing with soap and water will not generally remove the stains on egg spoons. Take a piece of flannel, damp it and dip it in table salt. Then rub the stains with this and they will rapidly disappear.

Paint marks on glass may be removed by moistening them with a strong solution of ordinary soda, which will loosen the paint. When all the stains are rubbed off polish with a little methylated spirits and a soft cloth.

The rind or skin of a pineapple contains an acid that affects the mouth and lips unpleasantly. For this reason the knife used for paring this fruit should never be used for slicing it without being thoroughly cleansed first.

If you want to shut off any view you can do it very cheaply with an imitation of ground glass. Dissolve as much Epsom salts as the water will absorb in a little hot water and paint it over the inside of the window. When dry you will have a very fair imitation of ground glass.

An ingenious woman has suggested a safe way of sending coins by mail when a coin card is not at hand. She places the coin between two thicknesses of blotting paper, which have been cut out a little smaller than the envelope and runs a line of stitching around the coin to keep it from slipping. The blotting paper is thick and light and will serve to keep the coin from wearing a hole in the envelope and from being noticed.

The quickest way to ruin an electric flatiron is to allow it to become over-heated. If the iron is in use the current may be turned on for a long period of time without injury to the iron, as the heat is thus dissipated by contact with the fabric being ironed. To go away, however, to answer the telephone or doorbell and leave the current on is decidedly injurious. After a few such experiences the iron will be burned out and cannot be repaired.

Hard hitters receive hard knocks and must be made to resist them. The man who bought a nameless hammer a year ago probably has a useless hammer to-day, with a battered, chipped and broken face, and a handle that continually comes out. To get a hammer that will last a lifetime, that never chips or breaks—that never works loose or flies off the handle—that drives straight and true—you must ask for a Keen Kutter Hammer.

KEEN KUTTER Tools and Cutlery

from a can-opener to a cross-cut saw—from a tack-hammer to a sledge, are as carefully made, tempered and tested as the finest surgical instruments. Keen Kutter Tools include Carpenter's Tools, and a full line of Farm and Garden Tools—Forks, Hoes, Trowels, Scythes, Manure-hooks, Lawn-mowers, Grass shears, Rakes, etc. Also Scissors and Shears, Pocket-knives and Cutlery. Sold for nearly 40 years under this mark and motto: "The Recollection of Quality Remains Long After the Price is Forgotten."—E. C. SIMMONS. Trademark Registered. If not at your dealer's, write us. At a meeting of fruit men held in San Francisco, July 9th, called because of the "unwholesome sulphured fruit" ruling by the Agricultural Department, the following resolution was passed: "It is unanimously decided that the United States Department of Agriculture be urged to delay all action upon the use of sulphur in the preparation of dried fruits as now prepared under our methods in California until some efficient substitute is introduced. Otherwise, our industry will be sacrificed."

Over 4000 acres of sugar beets are planted in Tulare county for the delivery to the Pacific Sugar Company.

The Produce Markets

Los Angeles

Markets

Butter.

LOS ANGELES, July 24, 1907.—Butter and eggs show the most activity in the market this week and are both advanced strongly over last week's quotations. Best grades of creamery now command 65 cents per roll. All better grades are well cleaned up.

Eggs and Poultry.

Eastern eggs continue to come in large quantities, but they have not prevented a stiff rise in the local fresh stock. In fact, the increased quotations are so pronounced that the condition looks speculative and the claim is made that the mark-up was purely arbitrary by the wholesalers.

The prices given are those of the commission man to the retailer.

Riverside Press gives valuable information regarding the productions of that county and especially of the grain and hay grown during the past year. In it it claims that 36,000 tons of alfalfa were produced in that section, and that it will aggregate \$500,000.

Vista Bonita Valencias, from the orchard of J. A. Graham four miles east of the town of Hemet brought \$4.60 a box in New York, and \$4.35 a box in Boston Tuesday, the 9th of July. These were the highest prices paid that day.

The apple industry of this State should be stimulated by the fact that this country is now importing quantities of apples from Australia.

One firm has closed for 500 tons of peaches to be shipped out of Hanford for canning purposes.

A thousand tons of peaches were contracted for in one day by the Fruitvale cannery.

Fresh Fruits.

Trading in fresh fruits was rather small yesterday, but there were noticeable changes in the prices. The best class of berries were more closely held and generally a little higher, while some of the other varieties were slightly lower. Receipts of the day were greater than the requirements and the close some of the dealers rather heavy supplies on hand. The strawberries met with a good inquiry and prices were held very steady. Blackberries were unchanged, while loganberries and raspberries were advanced in price. Peaches showed little change, the receipts being small and the quality of the stock rather inferior. Cherries are very scarce and dull.

NO TAXATION OF YOUNG TIMBER.

California forestry would be greatly advanced by relief from taxation of young growing timber, and a greater planting would be stimulated in a way gratifying to all. In Indiana they are discussing the relief of young timber from taxation. Though forest lands bring little or no income, they are taxed on their value as determined by what they would produce if cleared and cultivated. So that while the State encourages forestry, it at the same time in effect forbids reproduction of forests by private owners. It is said that under the State Constitution the only chance of exemption of young forests from taxation would be by classifying this as scientific. But unless the Constitution prescribes the principle of assessment, it would seem easy to reduce the taxation to a nominal figure.

TREE PLANTING IN NORWAY.

Norway is one of the lumber reservoirs of the world; yet the Norwegians appreciate the advantage of renewing their woods before they are exhausted. Tree planting has attracted much attention in recent years. United States Vice-Consul Alger reports there were nearly seven million trees planted in 1905, of which one million five hundred thousands were by school children and other young people. Forest planting is being introduced into the public schools.

THE TREE PLANTER.

He who plants a tree,
 He plants love;
 Tents of coolness spreading out above
 Wayfarers he may not live to see.
 Gifts that grow are best;
 Hands that bless are blest;
 Plant, life does the rest.
 Heaven and earth help him who plants a tree,
 And his work its own reward shall be.

The returns from oranges have been so satisfactory during the past season at Lindsay that improvements in the older orchards and extension of planting are general.

The Horticultural Commission of Yolo county reports the prevalence of much pear blight, but that it is being reduced by systematic work on the part of most orchardists.

S. C. Mason of the Department of Agriculture of Washington is in Fresno making observations in the fig orchard of Geo. C. Roeding. His object is to get information as to the Capri fig.

The question of box shook which has been perplexing to all orange growers is being discussed by Tulare county citrus men in hopes of securing better terms another year.

Santa Paula is installing a number of improved irrigation plants which are the means of saving great quantities of water and also facilitate its more economical handling.

Sutter county is making peach contracts with the canning companies on a \$60 to \$70 basis.

Peach drying season is now on in all sections of Southern California.

Riverside citrus output now aggregates something above 5500 cars.

Eighteen cars of California green fruits pass Sacramento daily.

El Centro creamery is improving its plant.

Fanning Mills**"The California"**

This is one of the most powerful and complete cleaners in the market, and is known as a double blast fan mill. The first blast operates as the grain passes in showers through the sieves, and in this operation the chaff and light stuff is removed. The second blast operates as the grain passes off the last screen in a thin stream and at this time the heavier particles are removed. These mills are rigged to clean beans.

We are also agents for the

Western Fanning Mill

This machine is not only a cleaner but likewise a perfect separator and in this respect will accomplish what no other machine on the market will do. Separates wheat, oats and rye, clover and timothy and makes them marketable in their class. Separates cheat and cockle from wheat. Separates wild oats from wheat, barley and large tame oat. Separates barley from wheat, and rye from wheat. Equipment is five screens and sieves, one-wheat zinc hurdle, a chess-board, tail-board and spout suitable for all requirements of a farmer. Will clean alfalfa seed perfectly. Will clean and grade beans. Alfalfa and bean screens are extra.

An Irrigation Canal, Alberta, Canada

THE production of crops through the artificial application of water by the method of irrigation is more ancient than our earliest historical records, and was, we now know, depended upon to produce the grain that made ancient Egypt at one time the world's granary.

On this continent, although Mexico and Arizona contain remains of irrigation canals and ditches constructed by a people prehistoric, the attempt to reclaim large areas for the homeseeker by large irrigation undertakings is of comparatively recent date.

Corporate and private enterprises in the United States have expended millions of dollars in introducing this certain method of crop production in the arid and semi-arid West, and now the Federal Government, under the authority of the "Reclamation Act," is undertaking the construction of irrigation works, the cost of which will ultimately reach some \$30,000,000.

Coincident with these developments along irrigation lines in the United States, farming by irrigation has been gradually introduced into Southern Alberta. Alberta is one of the new provinces of Western Canada and is bounded on the west by British Columbia, on the east by the province of Saskatchewan, and on the south by the State of Montana.

Alberta has already acquired fame both as a ranching and farming country. This fame has been gained largely without the aid of irrigation. But portions of South Alberta are capable of irrigation. The water is at hand, and the topography of the land is such that the water can be distributed at a comparatively small cost per acre. Furthermore, the soil and climate are admirably adapted to irrigation. These facts have all been thoroughly demonstrated, both by

the most critical examination made by the best experts on irrigation and by experiment; and, appreciating these facts, the Canadian Pacific Railway Company has undertaken the construction of an irrigation proposition which in point of acreage included is probably the largest undertaking of its kind in the world's history.

The tract included in this irrigation project is today one of the great ranching districts of Alberta. A luxuriant growth of natural grass with wonderful qualities of nutrition covers this entire stretch of country. It is the farthest removed from sand and sage brush, which are the natural conditions of land brought under irrigation.

On this great tract are cattle, horse and sheep ranchers, all of which thrive the year round without grain or shelter. Here are also occasional farmers who this year have raised wheat yielding as high as fifty bushels to the acre, and oats yielding 100 bushels, without irrigation. When these canals and laterals are all completed there will be about one-half of this tract that is still, and will remain forever non-irrigated. Here, then, are farms part of which are irrigated and part non-irrigated. The non-irrigated land is ideal grazing land, and in years of average rainfall is first-class farming land.

The above is from a description by Elwood Mead, which gives much information regarding the great section of irrigable land in that rich northland. The lands are being subdivided and disposed of by the Canadian Pacific Irrigation and Colonization Company at Calgary, Alberta, Canada.

From the above engraving one may gain a faint idea of the great abundance of the water supply and the magnitude of the undertaking to place these rich lands within reach of farmers.

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

2 to 60 Horse Power

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropic, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,

The Modern Milking Machine

A Description and Photographs by the Associate Editor
on the Process of Extracting Lacteal Fluid by
Machinery at the Rabb Dairy Near Los Angeles

I recently saw an amusing account of the experience of a prominent Los Angeles grocer, who, for the sake of amusement and little profit, is conducting a dairy where some exceptionally fine blooded cows are maintained. One of the embarrassments of this establishment has been the securing of competent milkers, and this embarrassment has prevailed not only on the ranch but on many others through the length

ances put into actual operation. The Rabb people begin their afternoon milking at about three o'clock, soon after which time our party arrived at the stables and found the milkers with part of the cows and the foot power milking machine diligently working on the remainder.

The milking machine was in the hands of Mr. John Houston, the foreman of the ranch. It was, of course, the first feature of the dairy to which

first pair of cows. Learning our errand, and that one of the first features of the trip was, to be a photograph of this machine in operation, he promptly liberated the first two cows from the stanchions which were in such a position that no photograph could be taken of them. They were taken to the corrals and there under the conditions different from those in which they were usually milked, they stood perfectly quiet while the milking was being done. This explanation accounts, however, for the appearance in the photograph of one extra helper who stands at the side of one of the cows to prevent its stepping over. This helper is never necessary when the cows are milked in their regular places in the stanchions.

The first photograph with Mr. Houston carrying the machine shows how perfectly portable it is and how quickly it may be taken from one place to another. With milk pail in one hand and machine in the other Mr. Houston steps from one pair of cows to the next as rapidly as if he carried only the milk pail.

The machine is placed between the two cows to be milked, and the milking was preceded by a light brushing of the dirt from the udder, though we could hardly see the necessity of this for no dirt can follow the milk under this method of milking. The next step was to take the four receivers which are hard rubber appliances, looking very much like a telephone receiver excepting that where the receiver is, is a soft rubber disk with opening to admit the teat.

With two or three strokes of the foot on the pedal, suction was produced so that the moment the tip of the teat touched the receiver it was drawn into place up against the udder. Then another, then the next and finally the last receiver is placed and cow number one is being milked much quicker than it has taken to tell it in these few words. Instantly Mr. Houston turned to the other cow with the other rubber hose to which was attached similar four receivers which were quickly applied; in the mean time keeping up the motions with his feet so that in a few seconds both cows were being milked. In two and one-half to three minutes the work was completed, the receivers removed, which can be done as soon as the suction is lessened, and machine and milk pail picked up and the same repeated on the next pair of cows.

There was no manifestation of restlessness on the part of these cows and the work passed off so almost noiselessly, and to the evident satisfaction of cow and milker that one cannot refrain from

Concluded on Page 115

Ready for Milking

Applying the Receivers

and breadth of California. To overcome this obstacle this particular dairyman invested in one of the latest milking machines, and to be sure it was given a fair test at its initiation went with it on its trial trip. All seemed to be in the right condition for a perfect trial of the new appliance until the instrument was placed between two cows who were not advanced in civilized methods to fully appreciate the advantages of the new fangled appliance. Nothing daunted Mr. Amateur Dairyman proceeded to get into the thick of the endeavor and was very materially assisting in his efforts to "soo boss" until, nagged by the strangeness of the appliance, the cow upset all calculations, the milk pail, the grocery man, and even the new fangled machine, nor did she stop with the upsetting of the machine, but continued switching around until it resembled a junk pile.

Not to be discouraged with this experience, the dairyman proved to be a stayer and after proper repairs had been made on the machine, it was again introduced to those self-same cows and today the machine and the cows are the best friends.

This incident created interest on the part of the rider to the end that when an invitation came from Mr. O. J. Weber, of the O. J. Weber Co., to accompany him in his automobile to the ranch of the Rabb Dairy Co. beyond Savannah on the old Monte Road, fifteen miles out of Los Angeles, he accepted with alacrity.

Many papers over the State have continually referred to various dairies being compelled to buy these machines because of the labor shortage, and almost invariably the comment made upon them has been such as to indicate their complete success. It was, therefore, a pleasure to make this ride and see one of these simple appli-

we looked, but at the same time it must be confessed the perfect cleanliness and sanitary condition prevailing in the stables was one thing which stood out and compelled us to take notice. The floors and gutter were almost as clean as the housewife's kitchen floor and lime and disinfectants scattered added to the appearance of cleanliness. This was not because of the expected visit of our party, for no notification had been sent that we were to arrive on this particular afternoon.

Pardon this digression for this is not written to call attention to the sanitary condition of dairies, but to speak of our experience with the milking machine which was at the time of our arrival in the hands of Mr. Houston ready for his

Deciduous Fruit Culture

PRUNING APPLE TREES.

WHILE the same general rules governing the pruning of apple trees apply to all sections, there are certain differences to be observed in different localities. For instance, pruning an apple tree to an open center in the vicinity of the coast is proper and safe; such work in the warmer interior valleys would result in many sunburnt branches and a short-lived tree. Trees in localities exposed to severe winds might be pruned lower than otherwise. However, the low-pruned tree is a favorite in California. It saves expense in picking the crop and the low-spreading branches protect the trunk from the sun. There is a limit to the low pruning of the apple that does not apply to some other deciduous fruit trees.

If the pruner is able to see the tree in his mind just as it ought to be when it is grown up to bearing size, he will save much time in making his orchard profitable. If, at the time his trees come into bearing he finds it necessary to remove branches that should have been removed a year or two before, there is a loss in bearing surface that very well might have been profitably distributed through a well-shaped tree.

Prune While Young.

Trees which are not pruned when young, will bear more fruit during the early stage of their growth; but when they mature they will lose when they should be making the most profits. The apple does not begin to bear till it has three-year-old wood and if it is allowed to grow a lot of wood that has to be cut off at that age or soon after, it is a serious loss.

Too Many Branches.

It is quite common to see apple trees with half a dozen or more branches. Some of these have to be cut out early in their bearing period. No apple tree can carry so many main branches and remain a good tree.

Most varieties of apple trees grow to large sizes and cannot be headed as low as most deciduous fruit trees. The apple has a spreading habit and cannot be properly cultivated if allowed to branch out and spread near to the ground.

Where to Head.

The best growers favor a head started two and one-half to three feet high. Cut so the top head will point toward the direction from which the prevailing wind blows. Do not allow more than three main branches to grow. If a branch fails to bring out a bud which is desirable to be utilized, cut a notch above it. Do not allow any branches to form lower than twelve inches from the ground. Aim to have the branches so distributed that they will be as far apart as possible and prevent crowding at a latter period. The branches should be cut back about half or third at the beginning of the second year. This is to give stockiness and bearing surface to the tree. If the tree is of a spreading habit, cut to an inside bud. If it is of a compact growth like the Northern Spy, cut to an outside bud. This will give a more evenly balanced top. It may be desirable to fill up an open space in which case cut to a bud pointing in that direction.

The Second Pruning.

The second pruning after planting should consist of culling to two branches on each main branch and cut back about half of the growth. This should be continued till the tree comes into bearing which will be in about four years from the time of planting.

Should trees be allowed to bear heavy crops they should be propped to prevent their getting out of shape. If the trees are once brought down out of shape by a fruit crop, they are down for good, unless brought back by pruning and this is expensive. It takes time to grow more bearing wood and not till then is it possible to raise a full crop.

These rules for handling young apple trees are not of the eastern apple grower, but are endorsed by the leading apple growers of this State.

KILLING SLUGS.

The so-called slugs that skeletonize the leaves of the cherry, plum, pear and rose bushes during the summer are comparatively easy to destroy.

As the slugs devour the surface tissue of the leaves in each case, they may be killed by a thorough application of any of the arsenical poisons such as paris green, london purple or arsenate of lead. Upon low plants it is equally as well to mix the poisons in twenty times their own weight of common flour and then dust them upon the plants through cheesecloth sack held in the hand.

In the case of the fruits, especially cherries, where it is not safe to use the above poisons, white hellebore powder may be used instead. If applied as a spray, put three ounces of the powder in one gallon of water as a dust, it may be used without dilution in a cheesecloth sack and light application made. The best time to apply the hellebore is toward evening.

The slugs can be removed from cherry, pear and plum trees by thoroughly sifting fine road dust, or freshly slacked lime over the foliage in the middle of a warm day, when the slugs are upon the upper side of the leaves.

Begin in time, be thorough, and do not let the slugs destroy your trees or roses.

AMERICAN APPLE GROWER CONGRESS.

The annual meeting of the American Apple Growers' Congress will be held in St. Louis, August 13-14. The executive committee of the organization is composed of: President, Henry J. Dunlap, of Savoy Ill.; secretary, T. Wilson, of Hannibal, Mo.; Geo. T. Tappin, of Nichols, Mo.; W. R. Wilkinson, of the Wilkinson Commission Co., St. Louis; J. W. Slanton, of Richville, Ill.; C. H. Williamson, of Quincy, Ill.; Clark Allis, of Medina, N. Y.; U. Cox, of Rockwood, O.; R. A. Simpson, of Vincennes, Ind., and L. A. Goodman, of Kansas City, Mo.

OFFICERS OF P. C. NURSERYMEN ASSOCIATION.

The annual election of the Pacific Coast Association of Nurserymen was held, recently at Salem, Ore., and officers for the coming year are: President, W. D. Ingalls, of North Yakima; secretary and treasurer, C. A. Tompkins, of Tacoma; vice-presidents, British Columbia, M. J. Henry, of Vancouver, B. C.; Oregon, A. Holodak, of Scappoose; California, William Nelson, of Fowler; Idaho, O. F. Smith, of Blackfoot; Utah, P. A. Dix, of Roy. The next meeting will be held at North Yakima, Washington next year.

If pecan nuts are soaked over night in water and then cracked on the end the nuts will come out whole.

Irrigation and Forestry

TRABUCCO CANYON NATIONAL FOREST.

S. Chapman, chief of office of organization of the Forest Service, writes Forestry and Irrigation, regarding the Trabucco Cañon National Forest:

"The forest is situated over the low rolling hills of the Santa Ana Mountains which lie south of the Los Angeles Valley in Southern California. The valley in which the towns of Riverside and Corona are situated adjoin the eastern boundary, and on the western boundary the hills slope down to the Santa Ana Valley. No towns or settlements of any size are situated within the forest. A paying tin mine is being worked on the west slope of the forest, and oil deposits are being developed in the Santa Ana hills, adjacent to the boundary, and it is probable that oil deposits will be found in the forest.

Game Grazing.

"The chief value of the forest is for the purpose of grazing. Excellent feed exists in the hills throughout the winter and early spring months during the winter rains. The feed dries up and the hills become barren during the summer months. There is very little agricultural land, but on the lower slope of the hills along the boundaries small areas of land in the stream beds are cultivated.

More Important.

"The forest serves its most important purpose as a conservator of moisture, and agricultural interests in the adjoining valleys are to some extent dependent upon the flow of streams originating in the hills. These streams flow only during a limited portion of the year, after the month of April very little water flows off in the bed of the streams. Considerable seepage continues under the ground along the stream channels, and this often is tapped by artesian wells. The value of the forest would be immeasurably greater if there were better cover over the hills. There is practically no merchantable timber in the forest. A few pulper pine trees occur along the west of the main ridge of the hills extending north and south, and along the stream courses which head back among the hills a scattering strand of live oak, cottonwood, alder, sycamore, and California walnut occur. Over the rest of the hills the cover is scanty growth of low chaparral of any species of shrubs native to Southern California.

"One of the most attractive features is the Trabucco Cañon, a narrow cañon, better timbered than most of the cañons penetrating the forest. In this cañon there is a luxuriant growth of native California palm, and the cañon presents an attractive appearance and is frequently visited by tourists.

"Considerable improvements have been undertaken by the Forest Service; roads have been improved and foot trails constructed up the cañons for the convenience of visitors, and so to connect points of interest. Several cabins and pastures have been built for headquarters for Forest rangers. A forest nursery is being established and planting will be undertaken with eucalyptus and other trees upon bare and chaparral grown areas in order to improve the cover and make the forest a better conservator of moisture.

Fire Patrol.

"The forest is protected from fire by

ranger patrol throughout the season of fire danger each year. In this way the chaparral cover which, in the absence of a growth of timber, is an important factor in retaining moisture, is prevented from being denuded from portions of slopes of the hills by grass fires which might run into the forest from unprotected private lands adjoining it."

THE KANSAS-COLORADO LAW-SUIT.

In a review of the famous Kansas-Colorado law suit, Forestry and Irrigation says:

This dispute between two States might have produced war in former generations, but our States instead of fighting, appeal to the interstate arbitration tribunal at Washington—the Supreme Court. The Arkansas River rises in Colorado and traverses the treeless plains, furnishing water for irrigation in both States; but the Kansas irrigators claimed that the amount of water withdrawn before it reached the Kansas line was so great there was not enough left for them, and they invoked the legal principle that all the dwellers along a stream have an equal interest in the whole stream, and hence asked for an injunction against withdrawal of the water by Colorado irrigators.

The Supreme Court, however, upheld the right of every State to allow and govern the use of water for irrigation, and to set aside the old common-law rule above mentioned, so far as it would apply to irrigation. The court further held that the United States has no authority to regulate irrigation, but that this is a State mat-

ter strictly. It held that if Kansas were actually injured in sufficient degree by the Colorado irrigation practice, then Kansas might bring suit for relief; but that as things are now the benefit from irrigation in Colorado is greater than the loss from low water in Kansas, and Kansas can not complain on general principles of irrigation being carried on, because it has made laws itself to encourage this practice.

Hundreds of witnesses were examined in the trial. Not only the authorities of the two States, but many private corporations were eager to be heard, and representatives from the United States were at hand to protect Federal interests. It is fortunate that the outcome of the trial favors the continuance of irrigation. If the settlers along the waters of an interstate river could not use its waters under the laws of their own State, for fear of trespassing on the rights of States further down, little irrigation could be done, for most of the rivers flow across two or more States.

ACTUAL SETTLERS GIVEN THE ADVANTAGE.

It is now the settled policy of the Government, when land is being released from withdrawal, to open it first to settlement; and then open it to entry (that is, to the filing of claims in the land office) only after a period of from ten to thirty days. The purpose of this is to give an advantage to the bona fide settler. The man who is on the ground first, and actually living there, is given preference under the law over any one who comes afterwards, and who might try to take up land for timber or mineral purposes under color of homestead entries. It is well known that this is often done; hitherto it has been diffi-

cult to prevent. The present policy will render enforcement of the law more easy.—Forestry and Irrigation.

A writer, connected with the Geological Survey, makes a strong plea for the establishment of a Federal drainage service for reclaiming the swamp lands on a basis similar to that of the Reclamation Service for irrigating arid lands. After briefly sketching what has already been accomplished in several States, he shows with the aid of a map and diagram where the sixty millions of acres of swamp are located, and estimates that if properly drained they would furnish homes for six millions of people and crops worth seven hundred and fifty million dollars.

Do not cultivate the beans when the leaves are covered with dew or are moist from a rain. Old growers say that if cultivated then, they will develop a great deal of rust. The writer has noticed this to be a fact. We can not explain it unless there is danger of inflicting slight wounds when the leaves and stems are tender because of the presence of moisture and through these wounds the germs causing the disease enter the plant.

The Auto-Fedan Manufactured by
THE AUTO-FEDAN HAY PRESS CO.
No. 28 Jefferson Street Topeka, Kansas

The only successful self-feed two-horse-power press made. Makes three strokes to the round. Feeder is attached direct to power, so it is bound to operate. **Two men can run it.** It is perfectly safe. Has a record for baling over three tons in one hour. Satisfaction guaranteed.
John Schilling, Agent, Garvanza, Cal.

AN ADMIRAL WITHOUT COST

3 FEEDS TO THE ROUND

SELF FEEDER

2 PROFITS IN HAY BALING

The difference in the increased earnings of the ADMIRAL THREE-STROKE SELF-FEED PRESS more than pays for the press in one season, at a conservative estimate of 2½ tons per day over the old style two-beat, foot-feed press, besides the ease of labor on both men and team, and better work. Let us figure a little to convince you.

2½ Tons per day for one week, 15 tons at \$1.50 net.....\$ 22.50
One month's earnings over the other press (26 days)..... 97.50
On an estimate of five months' work out of the year..... 487.50

The above gain with the ADMIRAL more than pays for the press.

**Because You
Need
The Money**

It's your business and if you don't
attend to it, who will? You cannot
afford to keep cows for fun. That isn't
business, and, furthermore, it isn't
necessary. There is money in cow
keeping if you go at it right, and be-
sides there is more fun in going at it
right than there is in staying wrong.

You need a Tubular Cream Separ-
ator because it will make money for
you; because it saves labor; because
it saves time; because it means all the
difference between cow profits and
cow losses.

Look into this matter; see what a
Tubular will do for you and buy one
because you need it.

Live Stock and Dairy**MORE SILOS.**

THE stave silo is more frequently
built than the other forms, where
fifteen to twenty cows are kept
it is the cheapest form. In districts
where dairymen lease their lands and
cattle for a term of years as is a com-
mon custom in California. The stave
silo offers the advantage of being
easily and cheaply taken down and
set up again in a new place. In many
of the Coast counties this renting of
land and cattle is the usual practice,
rather than the ownership. The wonder-
fully fertile lands of Marin and other
counties has been since the occupa-
tion of California in the hands of large
land holders. The outside world
knows nothing of the wonderful
beauty and richness of these Coast
counties, as the tourist never goes
there. I often wonder at the agri-
cultural possibilities of this State,
the hundreds of farmers living and
making wealth out of the soil that no
one ever hears of in the slightest de-
gree.

Early Stave Silos.

The first form of stave silo was
distinctly bad, worthless in fact. It
was a crude affair made of two by
four studding placed in a circle and
drawn up tight with an iron hoop.
The silage had to be removed from
the top and this was hard work and
alone should have served to condemn
them. Then they collapsed easily, or
swelling at the bottom sunk the ad-
justing bolts deeply into the wood
making it impossible to tighten them
up. The staves naturally gave in
every direction and when the silo was
empty and the wood dried out, some
of the staves buckled in and some
buckled out leaving air spaces be-
tween them. This was wasteful of si-
lage and also tended to make the
dairy farm look run down at the heel.
While it may be beginning at the
wrong end, yet a neat appearance on
the outside will help to make good
the promise underneath. It is said,
let a clean person constantly use a
dirty entrance and in time it will grow
clean from the influence of their ap-
pearance.

Modern Stave Silos.

The present day silos have the
edges of the staves beveled, tongued
and grooved; they are carefully
matched top, bottom and on all the
edges. The lumber is carefully se-
lected as the staves of a water tank.
The straight grained wood, without
knots, will exclude air better than the
cross grained cuts. The lumber used
is usually sixteen-foot lengths, where
it is desired to increase the depth,
the ends of the staves are sawed into
across the long way and a piece of
flat iron is inserted into the cut; this
makes it all air tight and anchors the
ends firmly together.

Foundation.

A flat cement floor is usually built,
the inside and outside is usually car-
ried up two or three inches higher.
This center ring is level and is about
four inches wider than the end of the
silo staves; this is to allow for expan-
sion and yet hold the building firmly
to its place of the foundation. The
hoops are made of round iron five-
eighths of an inch in diameter. The
rods are more convenient in sixteen-
foot lengths. The ends are provided

See us for Sanitary Milk Bottles...O. J.
Weber Co., 555-557 S. Los Angeles street,
Los Angeles.

with a long thread. The rods are
bent around the silo joining with iron
lugs and the nuts screwed up, at least
six inches being left on the end of
each rod to be let out when the silo
swells under the dampness of the
contents.

Doors.

The doors in a stave silo are read-
ily made by cutting them out between
the hoops, slanting the saw so as to
make the inner cut larger than the
outer. Then the silage will make
them bind tighter. A lot of mortar
laid on the sill edge, or even adobe
mud, plastered on them, thickly and
then shutting the doors will seal it up
tight. Another, and I think a better
way to put in the door, is to bolt a
frame around the opening for the door
to close on; this frame is made of
two-inch stuff and the edges of the
door are made tight all around with
any of the well-known roofing papers.

These two forms of doors with the
hoops running around continuously
are to be preferred to putting up a
wooden frame for the doors, held by
iron rods across it every twenty inches
and letting the iron hoops of the
silo come into through the uprights
and end on each side of it, with a
nut. This stiff frame has a tendency
to put out of level the silo when
empty and is best avoided.

Cost.

Oh, the power of money! What
will it cost? That is ever the cry!
When I look at glorious Mars these
nights I am glad that money cannot
buy the stars. At least, the sun, moon
and stars are safe for a while yet.
The first cost of the stave silo is less
by more than half that of the more
substantially built one. The ordinary
careless builder cannot make a success
of them. I personally would not like
to build one, but would go to the
makers of patent ones for prices and
have the material shipped in the
knock down. I believe like making of
tanks, that this is a special industry,
like barrel and puncheons. The pa-

tent silos are many, from all parts of
the East to the Pacific Coast, the mills
advertise them; I therefore, refer you
for this part of the story to the Cult-
vator advertising columns.

Roof.

The roof of the stave silo presents
considerable difficulties, when the silo
is placed outside the barn. If the roof
is firmly fastened it will be wrecked
by the expansion and contraction of
the silo walls. It is probably not
wise to leave the building completely
unroofed as then the sunshine into

the emptied portion and the shrinkage of the staves is thereby greatly increased. Making a square roof and hanging a weight from each corner has been tried successfully. Now comes the idea of an octagon with up-turned corners and a weight on each side. The effect is quaintly Japanese and quite decorative.

Effects of This Form of Silo.

It has been asserted that the silage has less feeding value owing to atmospheric action and changes of temperature through the thin walls. While this has been said, as yet it has not been proven, for it has not been tested by the Experiment Stations. To gain a stave silo must have a careful owner, one that has his mind on his work. He must tighten up the hoops, for when the silo is empty the hoops are loosened and the heavy winds may rack the silo to pieces. Where oak blocks are used instead of iron to fasten the hoops into the staves, the hoops are often found to have drawn the nuts half way through the block; this makes it impossible to either loosen or tighten the hoops. Then again watch that the foundation is such that the silo will neither shrink or expand off of it. These are the defects mostly pointed out; they should be weighed against the advantages before deciding which style to build.

Advantages.

That many farmers prefer the stave silo shows that the defects are not serious ones. The cheapness of the stave silo has brought them into use on the farms where dairying is not the main business. In New Jersey

and Pennsylvania over eighty per cent are of the stave form. In Illinois and Wisconsin, where the dairy is the chief work of the farm, the brick, stone and concrete or large wooden silo is more extensively used.

The only other way cheaper than the stave form to make silage, is to make a pit in the ground and fill it with the cut food. This was really the primitive form and in the early writings of the tenth century these are probably what are alluded to, as the way the people around the Baltic had green winter fodder for horses and cattle. The first of all silage making was probably in the caves and was an accidental discovery. It is Milton that says:

"Th' invention all admir'd, and each how he
To be the inventor miss'd; so easy it seemed,
Once found, which yet unfound most would have thought
Impossible!"

THE TEETH OF A HORSE.

In a discussion of this subject a horse man writes:

Decaying teeth are not uncommon in horses. This condition is usually indicated by a fetid discharge from the nostrils or a fetid breath. In some cases, difficulty is experienced in locating the diseased tooth, but when the disease has advanced to that stage in which it can be located it must be extracted.

Wolf teeth (those small, supernumerary teeth, which appear in front of the first molars in the upper rows) are generally supposed to have an injurious effect upon the eyes. This is a mistaken idea. They seldom do any harm unless they are large and in such a position that they inter-

fere with mastication; but being supernumerary and having no function, they should be extracted. The somewhat common habit of knocking the crowns off should not be followed. They should be drawn with a pair of forceps. I repeat that sufficient attention is not given to horses' teeth, and that a dollar spent for having them dressed is usually a good investment, while a bungling job does more harm than good.

A SKIN GAME.

Nine farmers out of ten run their dairy herds on the lottery principle. It differs from the regular nickel-in-the-slot-lottery in that it deals with dollars instead of cents and that if the game is run long enough and on a large enough scale the chances are that the fellow who plays it will lose out. A farmer goes to the city and sees a young man drop a dime in a slot, turn a handle and get five cents in return. He calls the youngster a fool. Then he goes home and during the next year he shoves \$40 worth of good alfalfa and milling-trust bran into Old Brindle and gets \$30 in return. Of course, he does not call himself any names, because he keeps no count either of the feed Brindle eats or of the returns she gives. He can not be expected to blame himself with a loss that he knows nothing about. He knows that he paid off \$500 on the new forty and supposes that Brindle did her share. She certainly did so, but if she had not done it her owner would have been \$10 ahead. The moral rests in the fact that most men who operate dairies, do not know what it costs to produce a gallon of milk.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

PASTEURIZE.

With the advent of hot weather the question of a wholesome milk supply is being agitated, especially in the large cities. Pasteurization is frequently recommended as a safeguard, while on the other hand, this process is often condemned. Dr. M. J. Rosenau, of the United States Public Health and Marine Hospital Service, has made an exhaustive study of the subject, and in his opinion the advantages of pasteurization so far outweighs the disadvantages that he unhesitatingly recommends compulsory pasteurization of all milk which does not come from tuberculin-tested cows and is not produced and handled under the best sanitary conditions. Of course, good milk does not need pasteurization, and clean raw milk is more to be desired than pasteurized unclean milk. But only a very small proportion of the milk on the market is fit to be used raw, and milk which would be dangerous in a raw condition may be rendered measurably safe by pasteurization. Pasteurization, therefore, may be regarded as a make shift to counteract unwholesome conditions, and it should be used only as a temporary measure while dairy herds are being freed from diseased animals and the dairies are being brought up to the required standard of equipment and cleanliness.

AMERICAN BREEDERS' ASSOCIATION.

The American Breeders' Association will hold its fourth annual meeting at Washington, D. C., January 28, 29 and 30, 1908. Secretary James Wilson, the president of the association, will speak and other able and prominent men are being secured to take part in the program.

The Ornamental Garden

THIS MONTH.

AUGUST is a good month for mulching, irrigating and looking after bulbs. Many may be taken up and put away in sand. Early planted gladiolus, which have blossomed and allowed to dry off may be taken up now. If they have been irrigated and are still green and growing, they may be dried off and as soon as well-hardened remove the bulbs and dry for early fall planting.

As to planting this is the best month in the year in which to sow hardy perennials. Most varieties if sown this month will flower the next year. Also sow Calceolaria, Cineraria, pansy and primula seeds. Continue growing Eucalyptus and Cypress seeds.

Don't water roses this or next month at all. Let them dry down. Be sure and get your pansy, stock and centaurea seed now. The latter should not be transplanted; does better to grow where sown. Sow sweet peas this month for flowering during holidays.

The old violet bed may well be overhauled and divided and annual vines that are hardy may be started now.

HOW TO MAKE LEAF MOLD.

Make your own leaf mold. When sod is removed from ground for any purpose, shake out the fine soil that adheres to it for future use; or slice off the fine roots with a sharp knife just below the crown of the grass. This is known as fibrous loam and, in combination with leaf mold, old manure and fine, sharp sand makes the very finest potting soil.

Throw the tops of the sods in a heap in some out-of-the-way corner and add the rakings of the yard in fall and spring, all weeds pulled during the summer, all vegetable refuse, potato parings, apple peelings, cornhusks and berry hulls—anything that has vegetable matter and will decay.

All dishwater and slops that are not needed on the garden may be thrown on the pile, which should be turned over occasionally during the winter. By the following spring you will have the finest kind of leaf mold. Not all of the pile will have decayed, but along the sides and underneath it will be found ready for use.

Add to it every bit of available vegetable matter during the year, including the annual flowers pulled up after their season of bloom, the tops of such root plants as cannas, caladiums, gladioli, etc., and you will soon have a supply quite adequate to the needs of an ordinary garden. Where there are waterworks the hose may be turned on frequently to hasten decomposition.

If it is impossible to replace all poor soil in the garden with better by the addition of leaf mold and manure, much may be accomplished in the way of building up the old and rendering it suitable.—Agricultural Journal.

• HYDRANGEA.

The hydrangea is in its full glory now and is really a thing of beauty. This shrub is so easy to grow it seems every one should have one. And this is a plant that would not be too common if every yard in the city had one. The larger pink flowers, in bunches often a foot across, attract the attention of every passer. They may be bought of a dealer for 15 or 25 cents each or if you have a good sand box you can soon root as many as you want. Cut off in about six to

eight-inch cuttings of new growth.

Take all the leaves off except one or two; put down so one or two joints are in the sand; cover well and keep moist. In three or four weeks roots will be formed all along the part covered. Now take them up and plant in good rich soil in small jars, or tin cans like a three-pound lard bucket. When they have got a good start turn the bucket upside down and jar the dirt and plant out so as not to disturb the roots.

Plant in good rich soil and keep well fertilized. They are rank growers and hearty feeders. Trim right after the blooming period, so the new shoots can form buds for the next season's blooms. If too high, and they have a tendency to fall, they should be tied up to the wall or to stakes driven near them for the purpose.

They do as well or even better in the shade or on the north side of the house, as they do in the sunshine. Get a "Hydrangea Paniculata Grandiflora" sure.

DEADLY COMMON PLANTS.

The things that give the most pleasure in life frequently can also cause the greatest pain, says a writer in Coleman's Rural. Among flowers, for instance, the beautiful snowdrop, the hyacinth, jonquil and narcissus are all poisonous, and to eat the smallest part of the root of either of them would produce fatal results, while the juices of the leaves will cause violent vomiting.

The berries of the yew tree have killed many people, and the opium obtained from poppies has also claimed its victims. Lady's slipper and lily of the valley are both dangerous, and if the blossoms of crocus are chewed they will cause vomiting. Flowers from bulbous roots, however, seem to be the most dangerous and it might not be out of place for dealers in these to label them with a crossbones and mark them poison.

THE ART OF ARRANGING FLOWERS.

Here are five golden rules which should be observed by those who often arrange flowers: Use plenty of foliage. Put your flowers in very lightly. Use artistic glasses. Do not use more than two, or at the most, three different kinds of flowers in one decoration. Arrange your colors to form a bold contrast, or, better still, a soft harmony. The aim of the decorator should be to show off the flowers—not the vases that contain them; therefore, the simpler ones are far preferable to even the most elaborate. Glasses for a dinner table should be either white, a delicate shade of green, brown or a rose color, according to the flowers arranged in them.

PROTECTION FOR FLOWER BEDS.

If you want your chickens to have the run of the orchard and lawn and also want to raise flowers, follow the suggestion of a correspondent in the Farmers' Tribune and cover your beds with woven wire fencing cut to the proper shape and size and fasten it down with forked sticks or something similar. It is neat and effective (preventing scratching while allowing weeding and all needful care) without being unsightly.

"He plays better than he sings."
"Oh, have you heard him play?"
"No, but I have heard him sing."

Bees and Their Care

AMONG THE BEES.

The successful apiarist must have a fund of knowledge peculiar to his craft for a colony of bees are a well regulated body, well officered and equipped for the transaction of business, and any untoward interference with their arrangements is generally to the detriment of the invader, says a writer in Coleman's Rural.

We have had several years' experience with this branch of farm industry; in fact, we have but a vague remembrance of the time we didn't "keep bees." We read with interest of the success of those who keep bees on improved methods, but our experience has been best when we have kept as nearly along the lines they follow in their natural behavior, says a writer in Prairie Farmer. We have prepared boxes, cleaned, salted and well rubbed with peach leaves, according to the methods handed down to our predecessors. And yet, after being hived, and apparently well satisfied with their new quarters, they have sped away for the trunk of a decayed tree the interior of which would be crumbling, sour and infested with wood-worms. Occasionally if the swarm was worth more than the tree we would fell the tree, split the hollow portion open, set the discarded box over the opening and the bees were ours "for keeps."

Some seasons the bulk of our swarms would take to the woods, and usually at such a rate of speed that it was impossible to locate them. In these seasons the bee hunter reaped a rich harvest. In more recent years, since the timber has been cut off, there are but few trees in which they can harbor. This following them to the woods and carefully noting their habits will furnish valuable information useful in the construction of their hives.

One point to be observed is that they select trees with irregular hollows wherein to store their honey, for a comb full of honey is apt to break from its own weight unless it is otherwise supported. Then in preparing a hive we find it necessary to place supports for the combs. We still use the oblong box set on end that, when filled with honey, will weigh thirty pounds. This allowance of honey is necessary and sufficient for the winter support of a colony of bees.

We use small boxes on top of these permanent hives for our share of the honey. This part we remove as soon as it is well capped so there is then no danger of the honey leaking from the comb. We have tried various patent devices for bees, but either failed in the manipulation of them or they did not suit the requirements of the bees as well as the old-time hive. Of course a professional apiarist, who could devote much time to the work, might find these devices superior to our methods, but for the average farmer who keeps a few bees as a side issue, the more simplified methods serve the purpose best.

When one can arrange to be among his hives a great deal they yield the best results possibly from the fact that he can detect anything amiss and correct the disadvantage before it proves too great a hindrance. Ants and mice are formidable enemies to the apiary, while a skunk, in one night may play havoc with a colony. There are bee-eating birds that will weaken the colonies. Sometimes, too, chickens acquire an appetite for bees, but this is of but rare occurrence.

SELLING THE HONEY.

The question is often asked, how it is best to sell honey. Naturally each beekeeper must decide this for himself and select the method best suited to his needs and location. A correspondent of the Progressive Beekeeper has this to say:

If the commission men sell your crop the money comes in a lump, in retailing it comes in smaller quantities. In selling to the consumer it is a good plan to give him a sample of the (extracted) honey that you have to sell; let him taste of it, and if all the whole family is present let them all have a taste. The children often will persuade papa or mamma to make a purchase. If you keep a horse or a cow, you can often make a sale by trading for oats, corn or hay; eggs are good trading commodity; even if you do not need them for family use you can trade them at the store for something needful for the family. You can often dispose of honey by thus trading, whereas they would not pay money. For feed for horse or cow you must pay cash; why not make the trade? Both are accommodated; you have got some feed and they the honey. When that is gone—"well we must get some more." Perhaps one or two of the children can help you sell your crop; you give them a good commission for selling and they will take great interest in bees, because they have made some money out of the transaction.

Children like to have a little money all their own as well as the older ones of the family. If you produce extracted honey and wish to put some into the stores, pound and half-pound bottles are neat packages. Jelly glasses are used by many. I dislike them on account of their leaking under the cover; honey smeared down the sides of the glass does not present a pleasing sight. If you go to the store to buy a box of berries you select a box that is neat and attractive; you do not care for a mussy box. Do the same by your honey, whether in comb or extracted; make it appetizing by neat appearance and quality; always produce honey "that tastes like more." You should not forget to advertise in your local papers something like this:

"Wanted, to Exchange—Honey for eggs, oats, corn or anything useful—yes, silver dimes."

FOUL BROOD.

Drugs can not be recommended for foul brood in bees. It has been claimed that placing medicines in the water or food for the bees, or fumigating with certain drugs, will correct the trouble. While the latter remedy has been attended with good results it can not be recommended by the most experienced bee keepers.

The first practical step in the treatment of this disease is to remove all the infected material from the hive. This may be done by shaking the bees into a new clean hive, care being taken, however, that none of the infected honey falls into the hive. This should be done at a time when there are no robber bees or when other bees in the apiary will not rob them and thus spread the disease. Great care should be exercised to keep all infected material away from other bees until the combs can be rendered into wax or destroyed.

The three essentials of the best farm wagons are:

- The toughest wood stock thoroughly air seasoned.
- Proper construction and ironing to give the greatest possible strength.
- Light running qualities for the longest possible time.

This describes the wagons of the International Harvester Company line.

More than that, these qualities are combined in wagons of the handsomest appearance. They are built for the maximum of durability along the most pleasing lines.

The Weber The Columbus The Bettendorf

are old established makes with well known reputations for superiority.

The Weber, a strictly high-grade farm wagon, has been one of America's leading farm wagons for more than half a century. It is constructed of the very best material obtainable and is adapted to all conditions of climate and service.

The Columbus is known in all markets as a wagon well designed for general farm purposes, and constructed to meet the requirements of a good farm wagon.

The Bettendorf has an all steel front and rear gear which cannot warp, bend, rot, or shrink under any condition of climate or service, and is capable of sustaining unusual loads.

It makes little difference which of these wagons you buy. You will make sure of wagon value and wagon satisfaction in any event. You simply can't buy anything better at any price.

You should know more about these wagons than we can tell you in this small space. Call on the local agent and look them over, or write nearest general agency for our wagon pamphlets which fully describe each.

Western General Agencies: Denver, Colo., Portland, Ore., Salt Lake City, Utah, Helena, Mont., Spokane, Wash., San Francisco, Cal.

International Harvester Company of America,
(INCORPORATED)
Chicago, U. S. A.

The Department of Agriculture advises that the wax rendered from infected combs should be done at a high heat and not by the solar wax extractor. The honey from a diseased colony should be diluted with water and then thoroughly sterilized by hard boiling for at least half an hour. This is especially necessary if it is to be fed back to the bees. If the hive is to be used again, it should be thoroughly cleaned with concentrated lye and then washed out with boiling water. Three or four of these washings should be made to remove all the lye. Some keepers sandpaper the interior when the hive has been dried after the fourth or fifth washing.

The following is advised by a practicing physician as a good remedy for bee stings: Tincture of iodine, one ounce; spirits of camphor, one ounce. Mix well and apply to the stings. If a salve is desired, mix equal parts of baking soda and vaseline and apply to the stings as soon as possible.

Housewife (to new domestic): "There is one thing I wish to say to you. The last girl had a habit of coming into the parlor and playing the piano occasionally. You never play the piano, do you?"

New Domestic: "Yes, mum, I plays; but I'll hev to charge yez half a crown a week aixtry if I'm to furnish music for the family."

General Agriculture

DRY FARMING.

MORE and more the advantage of "dry farming" is being pressed upon the attention of farmers. Many sections of the semi-arid West are greatly increasing their wealth by more attention to the "little things," which is declared to be the cause of success in this feature of agriculture.

Regarding the methods, a circular from the New Mexico Experiment Station says: "The principles of dry farming are by no means new to agriculture. The fundamental principles involved are the same the world over. The differences appear only in the varying conditions of soil, water, climate, etc. For example, under dry farming conditions we cannot, as under irrigation, substitute water for cultivation, because in the case of the former there is no excess of water available.

All the operations of dry farming cluster around two important features, namely, the formation of a capacious water storage "reservoir," and the conservation of the soil moisture until the season of the year when the crop can make the best use of it. The soil must be loosened up by deep plowing so as to permit the rain to penetrate it—not a single drop being allowed to run away over the surface. After the water has soaked into the soil it must be prevented from returning to the surface, to be evaporated and lost. Should the soil be left rough after plowing, a large surface will be exposed to the air which will result in the loss of much soil moisture. Leveling the ground at once after plowing will result in the least amount of surface exposure to the desiccating power of the air and wind. Very much less moisture will be lost from a smooth surface than from a rough surface. Furthermore, pulverizing the surface retards the movement towards the surface of the moisture in the deep layers of the soil. Surface cultivation must be continued at frequent intervals, not only until the crop is planted, but also for sometime thereafter, even with the cereals. By deep plowing, and level thorough, timely cultivation we may hope to succeed; without them we surely will fail.

Dry farming requires strict attention to detail, and every operation must be performed at the proper time and in the right manner. Neglect is intolerable, and it makes not the least difference whatever, whether the neglect is a result of ignorance or of carelessness. There is only one road leading to success in dry farming and that is, to know the underlying principles governing tillage and unhesitatingly to practice methods, which, by repeated trials, have demonstrated their soundness." As to some of those details the Cultivator will give more at length later.

"I would rather have developed this place than to have built a cathedral." This was the tribute paid by Tree Warden J. H. Reed to the enterprise of the Chases in developing their great orchard property at Corona, on the occasion of his visit there this morning with a party of Riverside citizens. And this spontaneous expression from Mr. Reed was unanimously voted to be a most fitting statement of the feeling of admiration felt by every member of the party.—[Riverside Press.

DODDER.

The Cultivator often has inquiries regarding dodder and how to rid alfalfa fields of it. We quote the following in the Journal of Agriculture, which has largely been given in The Cultivator, but we repeat because many are still asking as to this pest, and one subscriber recently sent the office a sample of the parasite, not knowing what it was:

One of the worst pests to clover and alfalfa meadows is dodder. This is a parasite plant that grows from seed in the ground, but as soon as the plant reaches the stems of the host plant it depends no farther on the soil for sustenance, but fastens itself to the stems and stalk of the host and saps from its life juices. It is practically leafless and the stems are nearly yellow in color. Its thread-like stems wind themselves around the stems of the host plant. They draw their food from the plant on which they live by means of small root-like projections which are thrust through the bark of the host plant. There is but one practical means of eradication, and that is to cut both the host plant and the dodder, allow them to cure and burn all together on the ground, where the dodder has been growing. It is important that this should be done before the dodder goes to seed. The time of seeding depends of course upon the location, however, we have found that the dodder can be effectively destroyed any time before the clover blossoms begin to die. The grass should not be raked but spread out over the field. In burning in this way the stubs of the clover on which some of the dodder plant may remain may also be destroyed. In case the plant has seeded and there are signs of the plant after the patch has been burned over the stubs of the clover should be hoed once or twice to prevent the plant from infesting the next crop. If the patch is a very large one, some kind of a hoe blade should be made and attached to the beams of a common double-shovel plow and the patch hoed with the horse. If the blade on the horse hoe is kept sharp, the stubs will be easily cut. Spraying with chemicals has not been found to be satisfactory.

Rib Grass—This is another grass that is becoming quite a pest in the meadows. Since it is a perennial, that is, it may live for a number of years without going to seed, it is impossible to destroy even by cutting it before it does seed. The only practical method is to plow up the meadows as soon after the crop of hay has been removed as can be conveniently done. Disk three or four times during the fall and the next spring plow again if necessary to turn under any growth of the grass, if not disk well and harrow several times and plant to corn so the ground can be plowed both ways. Keep in corn two years if the soil is rich, then sow to small grain and seed to meadow again. Generally by this time the grass will be entirely destroyed. If not, sow cow peas as soon as the small grain has been harvested and plow under late in the fall. Follow with corn, alternating with small grain and cow peas till the grass is eradicated.

If you aim to keep bees for a profit, keep your stock of bees according to your pasture. It is just as easy to run short of pasture for bees as it is for stock.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

With the Citrus Growers

FROST OR VETCH?

WE RECENTLY visited a grove in which the oranges were being harvested. There were two varieties and they were almost void of juice. The fruit looked all it and hung onto the trees with the assistance of a puffy orange. The grower knew it could not be caused by vetch because none of the fruit dropped. He had grown a heavy crop of vetch the winter before and he was sure that vetch had robbed the trees of the moisture at a critical period and the oranges had never become filled up in. Still the trees in the mean while had made a good growth and set their crop. We were told that this grove had never been frozen, not even "killed" and with the exception of a cold spell in the fall, it had been a mild winter. In this identical orchard we found a tree that was growing under a large overhanging cypress. There were some oranges left on this tree and they were juicy and heavy of fine quality. The cypress tree acted as an umbrella and protected the orange tree from the cold. It was an unusual occurrence for oranges to be so fully frozen and not drop, but it must be remembered that the cold spell of winter that froze the oranges last winter, was followed in a very few days by a rain that continued for a week or more. When the rain stopped, the trees had recovered and the rain stimulated the action of the sap, which did not mend the injured cells within the fruit. In other sections where the cold injured the fruit, large Washington Navels were so badly frozen that they were not fit to eat when picked in April, being dry and shaly, though in outward appearance they were fine in form and color and clinging tightly to the tree. Much of this fruit has been shipped and without doubt to the injury of the particular orchard under which it was shipped. It has been considered that rain following a freeze is a most fortunate occurrence. No doubt that. It is better for such fruit to drop which it will do if not picked soon after a freeze.

ORANGE SOILS.

If asked which are the best orange soils, it would surely be a hard question to answer. We sometimes think it is not so much what particular kind of soil is best as it is the treatment that is given the grove after it is planted. The situation has as great an influence as anything perhaps. Soil that is heavy and soil that is light in texture will both produce good oranges which means also good trees. When planted on the most sandy soils which have substrata that will not allow the water to drain off too rapidly, orange trees grow to perfection and produce fine fruit. Trees planted on soil so heavy that it will crack when allowed to become dry, will also produce the same. If the trees have sufficient moisture and the proper kind of fertilizer and enough of it, the trees will grow and produce good fruit, provided the situation is proper and good care is taken of them. These two last named requirements mean the difference between success and failure. Trees grown in a situation that is too cold will not bring profit to the grower no matter what the soil or care is, still, many young groves are being planted in such places. The last few years have been favorable to the orange grower and the territory is being expanded in some places, beyond the safety line. This has been done before

and followed by regrets. The orange tree will stand much more rough treatment than the great majority of other kinds, but it will not give a profit unless the situation is within certain temperature lines, no matter what the treatment may be. We recently saw in the newly opened desert region, orange trees growing thriftily and bearing good crops on soil that drifted in the wind and would not resist the pressure of the foot on unplowed land. Trees just as thrifty and productive were growing on soil, which, when irrigated one day, would crack open the next. The climate seemed to suit these trees, the treatment was fairly good and the soil was rich, but opposite in physical makeup.

NITROGEN GATHERING BACTERIA

In an address before an Illinois farmers' institute, Dr. Burrill referred to the nitrogen gathering bacteria as follows:

"There are peculiar bacteria which are not invariably found and which certainly are not everywhere present among the hosts of living organisms commonly at home in fertile soils. After much careful investigation and no little difference of opinion, it has been conclusively settled that while green vegetation cannot make direct use of the free nitrogen of the air, the combined nitrogen, in the form of nitrates is absolutely essential to their life and growth. These nitrates are, as we have seen, freely soluble in water and tend to leach away. If, therefore, we should return to the soil everything that grows upon it, we should still find fertility decreasing, unless in some way nitrogen can be added from an extraneous source. The store of this substance is not inexhaustible in any soil. In spite of any contributions which could be made from the products of the soil itself, whether these were fed to animals or not, this essential element of fertility would constantly diminish."

Now we know that soils in nature have not thus deteriorated. Without help from men they have through thousands of years gained instead of lost their nitrogenous supplies; though it must be true that great losses have in the meantime occurred by drainage. There must, therefore, be some means of supply, some accession from without which more than balances the losses. If green vegetation cannot absorb and confine the free nitrogen of the air, of which the quantity is practically unlimited, something else must do so."

"How the clover acted as a fertilizer was not known until about fifteen years ago. Since that time our knowledge upon the subject has very considerably increased, and every year now something more is learned. Leguminous or pod-bearing plants unaided have no more ability to help themselves to the nitrogen of the air under any circumstances than have other green plants. Certain bacteria existing in the soil penetrate the soft tissues of young roots of legumes and multiply within these living tissues so as to form a little mass of gelatinous substance. Responding to the irritation produced about the bacterial invaders not unlike the formation of a gall consequent upon the sting of an insect, numerous nodules may be formed on the roots of one plant, and they have characteristics peculiar to the species of plant on which they occur. Some are characteristically much larger than others, or they grow in different shapes, or have different forms of grouping. In some way not well un-

derstood these plants with nodules or tubercles are capable of getting sufficient nitrogen from the air abundantly to serve their purposes when the soil has no supplies."—Coleman's Rural.

CAREFUL FRUIT HANDLING.

It has taken years to learn the necessity for extreme care in handling of fruits. We believe it may be said that nearly all fruit shippers knew in a vague way that great care was necessary to the best results. But this knowledge was not sufficient to secure action till Mr. Powell came and preached the gospel of greater care. And even yet it will take hard knocks in the shape of losses to convince many of the necessity of great care. On this point the Riverside Press recently remarked:

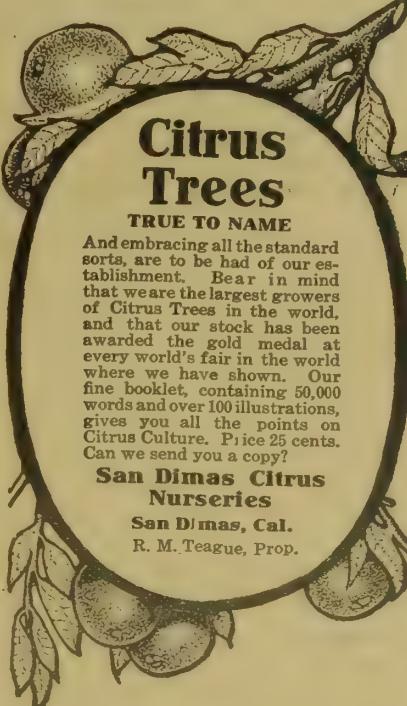

Too many men pay no attention to the scientific and practical tests that are being made for their benefit, but are content to go on in the old way. And those men are losing money simply because they lack the intelligence and enterprise to avail themselves of the results of Mr. Powell's work and the valuable advice he has been able to formulate as a result of his investigations.

This fact is certainly true—the growers and packers of Riverside who have been prompt to act on Mr. Powell's suggestions have made the big money on oranges this year. More careful and intelligent handling all the way from the tree to the car, has largely eliminated decay and resulted in the fruit reaching the Eastern market in condition to command the highest prices. The difference between \$3 to \$4 per box and \$2 to \$2.50 per box in the Eastern market is the difference between a small margin of profit and a return so generous as to make the orange business remunerative enough to attract investors and settlers here from all over the country. The men who have been getting these fancy prices have spent more money in producing the fruit and in handling it than others have; but, if the oranges have cost them 15 or 20 cents a box more, they have sold them for \$1.00 to \$1.50 more. The ex-

tra cost, therefore, would seem to be a mighty good investment.

We have reached a point in the orange industry when it no longer pays to grow poor fruit or to pack and ship it in a slovenly manner. There was a time when the output of our orchards was so small that there was a market for most anything that could be called an orange. But that was a long time ago; present conditions are such that the only way to make money in the business is to make use of all the improvements science and experience suggest and to put the same amount of intelligence and enterprise into the proposition that would win success in any other venture.

The growers who have not been studying Mr. Powell's work and acting on it have had some pretty stiff jolts this winter in the great range of prices; and if they are wise, they will study his latest report and go to work to profit by it next season.

Citrus Trees
TRUE TO NAME

And embracing all the standard sorts, are to be had of our establishment. Bear in mind that we are the largest growers of Citrus Trees in the world, and that our stock has been awarded the gold medal at every world's fair in the world where we have shown. THE SMALL FARM

The Cultivator has been a constant advocate of the small farm proposition. The attention of the editor was directed to the study of small farms by observation while a resident of Iowa. There, as in Nebraska, Kansas and other Middle West States, the general farms are big amounting sometimes, to several hundred acres. These the owner usually attempts to cultivate, but more frequently discultivates because of the scarcity of hired men. Naturally there is great waste on these big farms. Crops are not gotten in on time, rain damages them and winter overtakes them standing. It is a reasonable per cent to give when we say that at least 15 per cent of the grain product of these States is lost annually through inability to harvest them. Now, where is the economy in owning a large farm on which 15 per cent of the grain profit is thus lost, and where is the pleasure in owning a big farm to kill the family in an effort to run it? Taxes must be paid, fences kept up, buildings repaired, living gained, all of which it were easier to do on a smaller but better tended farm.

Our attention is again called to this favored topic of discussion by a letter just received from a farmer resident of Illinois, who it seems has had the experience so common to all eastern farmers. In this letter, Mr. Plinius of Santa Clara, says: "Six years ago I came to California from Champaign county, Illinois, I owned and farmed 640 acres of as good land as lies in that county. I worked myself, and my family worked

themselves almost to death to farm our land and make it pay. It paid, of course, but since I have been in California I have made more clear money from 25 acres of fruit and vegetables than I did off of 160 acres corn, and we have none of us worked more than we felt was good for us."

Now there we have the idea of a small farm as against a big one. More land, more work, less profit, eternal worry. The only mistake the Eastern farmer makes when he comes to this State is in not culling down his imagination to the actual necessities of his case. Ten acres are enough for any family to work. Better a ten-acre tract thoroughly cultivated than 20 acres half cultivated. Take the small farm.

OUR TREASURY SURPLUS.

We are confronted with the largest treasury surplus in time of peace in the history of the government. At the close of the fiscal year, June 30, the national treasury balance was reported to be \$87,000,000, truly a stupendous amount.

This vast aggregation of ready cash suggests some reflection. "If in the face of national expenditure unprecedented in size for a year of peace," says the Literary Digest, "the national treasury surplus is so unduly enlarged, why is it not an unanswerable argument for a decrease in custom duties from which the revenue is in large part derived?"

No economist will take issue with this suggestion no matter whether he is a protectionist or not. We all know that high tariff duties create high prices, and that the common people who directly suffer by reason of these high prices are the ones who in the end furnish the nation with its enormous treasury surplus. The rich contribute their quota of course, but they are so greatly in the minority, compared with the common people, they do not constitute an element of consideration when discussing this subject of tariff revision.

Personally, we have been a stalwart in the belief in high protection, but the time has come when Congress should revise the tariff list and reduce a good many articles to a lower level, putting a number of the essential materials which enter into our home life and industrial development on the free list. Lumber is one of these. A dozen, or so, other commodities might be mentioned as equally suggestive of revision.

The nation does not need so vast a surplus in time of peace.

Let our water ways be rehabilitated to ease the congestion of the railroads and furnish additional transportation for our products to the markets of the country, this will use up several millions of the surplus and be a direct and lasting benefit to the industrial classes. The Florida Agriculturist has come to the conclusion, as its editor writes, (this is his language) "personally we have always been a staunch protectionist, and still of the same belief in theory, but practically we have reached the conclusion that we are too much protected." That is the conviction thousands of protectionists have reached, and Congress will have to sit up and take notice of this change in public opinion. We do not mean to stand for free trade as the Bryan school would have us do, but to so revise our tariff as to make rates more just and equitable all along the line.

In one way the treasury showing augurs splendidly for the future of the country. We shall certainly have no panic while the treasury is so replete with cash. The outlook is healthy and there appears no sign of disturbance on our financial horizon. This being the case it is a good time to stop and revise some tariffs which affect the common people directly, but will not materially reduce our customs duties, at least to an extent which would endanger the republic.

RAILROADS AND CROPS.

Apparently the scare of railroad magnates is over and they begin to figure on the outlook for this fall's business. Up to a month or two ago, with one or two exceptions, they persistently preached that the enforcement of the rate law would paralyze business generally and drive the railroads into bankruptcy. The shortness of crops in the corn producing section of the country was paraded as the last straw which would work the ruin of the railroads. But today there is hear no more of this calamity cry. Instead, the

managers of the trans-continental lines are busily engaged figuring how they will get cars to move the crops to market and thus keep the motive power employed. They have ceased worrying over the prospect of short crops and light trans-continental passenger traffic and, in fact, make no hesitancy in saying there is going to be all the business they can take care of. Discussing this subject with a well informed railroad man the last week he said: "The car shortage of last fall and winter are ample proof that when there is a great crop of grain or fruit, the railroads are utterly incapable of transporting it. A few years ago the announcement of a possible crop shortage would have created consternation among the railroad kings, but just the opposite the case today. Then they had to depend on farm shipments for the greater part of the business, as the West was comparatively a new country and farming was its chief industry. Now, however, this section of the country is vying with the East as a manufacturing district and the railroads obtain a great deal of their traffic from the shipment of goods made in western factories."

In addition to the factory output also, the West particularly the Pacific Coast, with its constant increasing population, is demanding ten cars of coal where one was needed ten years ago. The citrus industry has increased to more than double its former quota and has suffered severely the past two years from the inability of the railroads to care for it. Then, too, passenger traffic has become enormous between the East and West, and the question is not "can the railroads get the people to carry," but can they care for the people they will carry? So, from a purely business point of view, the rate bill is not going to reduce the earning capacity of the railroads, nor is the two cent passenger rate, now in force in many Eastern States, going to cut the profits in that department very materially, for the reason that long hauls now count straight two cents where before they were computed at one and a half cents. A ticket to Omaha and return from San Francisco or Los Angeles, formerly cost \$60. Now it costs \$80, and as the law prevents cutting rates the price will have to rule at about that figure.

But it is not upon the passenger traffic that the railroads depended for their revenue, but farming and farming is still the chief industry. So in a few weeks we shall doubtless again hear the cry of car shortage and our orange growers will be hard pushed to get cars to move their product.

By the way, what has resulted from all the investigations the interstate commerce commissioners were making last winter about car shortages and coal famines? The work should have stopped now that the quiet season has begun. This is the very time to insist that cars be provided to move the orange crop. If the Exchange and other associations wait until next winter before taking decisive action, the same conditions will exist then as they did last year. Past experience has shown that the railroads will not spend a penny on improvements unless forced to do so. Let's not sleep on uncertainty in the present stance.

ASTONISHING INFORMATION.

In the June number of Mertz Magazine, Speaking of the Live Stock Tribune, and its recent change of ownership, the editor refers to former contributor to this paper as follows: "Mrs. A. Basley, for years editor of the California Cultivator, and at present occupying a similar position on the Los Angeles Sunday Examiner, is the editor of the Live Stock Tribune etc."

Mrs. Basley never was, nor never pretended to be the editor of the California Cultivator, nor the Examiner, either. She was one of a dozen strong contributors to the columns of this paper her department being confined to poultry. In this connection, we may say, she is a versatile well informed, conscientious writer on poultry, especially strong on the care of young fowls. Mrs. Basley is now editing, most acceptably, the Live Stock Tribune, which she purchased some months since; her place on the Cultivator being taken by Frank H. Thomas, one of the most useful writers on poultry subjects in the State, as well as one of the most successful poultry breeders. He is one of the four judges appointed this fall for the poultry department of the State Fair. His name alone won him this distinguished honor and he will make good.

August 1, 1907.

News of Country Life in the Golden West

Southern California Northern California

AGRICULTURE.

Over a dozen cars a week of hay and grain each are shipped from Hemet.

An effort is being made to establish a beet sugar factory at Santa Ana.

San Diego fined a milk man who used formaldehyde in his city trade, the sum of \$100.

Elsinore honey is ruling at high figures and bringing satisfactory returns to the bee men.

Since California won first on her peanuts there is increased interest in the growth of the goober.

The Neuvo Land Company has subdivided its large holdings near Riverside and will sell it off in small ranches.

W. W. Van Ornum of Hemet raised over 400 sacks of potatoes on five acres. Sold 340 sacks for \$565, saving balance for a second crop.

Mentone Irrigation Company is appealing to the Supreme Court for reversal of the decision in its fight with Redlands Light and Power Company.

From many sections of Southern California the report comes that Black Leg has broken out and is causing consternation in the cattle-breeders ranks.

A representative of the State Fair has been in various sections of the State of California creating interest in that event which comes off about one month hence.

Owing to carelessness of campers in Santiago Cañon, back of Santa Ana, a fire patrol has been placed there which will probably arrest any who are too careless.

San Bernardino has established a rule by which all sellers of milk within the city limits must secure a permit from the Board of Health. It is causing much unfavorable comment.

The Colorado river has receded very rapidly lowering at the rate of two feet a week. The rapidity with which the fall is coming is causing some concern on the part of irrigators.

Los Angeles city council has placed a license fee of ten cents on each hundred gallons of milk sold inside the city limits, and thirty-five cents on each hundred gallons of cream.

Riverside boasts of a sunflower, the stalk of which is over twelve feet high, measuring three feet in diameter at the base, and has a blossom twenty inches in diameter. Must be from Kansas.

With the U. S. importing over a million dollars worth of peanuts, farmers in Southern California are getting busy figuring on some of that money at home. Orange county is at present our heaviest producer.

Experiments are being made in the San Joaquin ranch below Santa Ana, in the raising of asparagus, rhubarb and celery. This year forty-five acres are to be set out as an experimental plat and if successful three thousand acres will be set out later.

Secretary Garfield, Gifford Pinchot, U. S. Forester; F. L. Newell, head of U. S. Reclamation Service are expected in Los Angeles next week. Efforts will be made to bring about more perfect watershed protection as a result of their visit to Southern California.

HORTICULTURE.

Redlands has shipped twenty cars of lemons up to this time.

Watermelons, near Santa Ana, are said to be a rather shy crop this year.

Fullerton packing house is now busy with the final output of Valentias.

Santa Ana Register reports peaches with fair crops and fruit in fine condition.

Redlands is to have a pre-cooling establishment in service for its next year's output of oranges.

The end of the cantaloupe season of the Imperial valley is nearly here. It has been a most successful season.

One packing house at Azusa averaged \$5000 per month paid to orange and lemon packers during the season.

Fumigation of orchard picking boxes is to be a factor in next year's fruit campaign in the orange groves of Redlands.

Walnuts are being reported as "fair to middling." In some sections nuts have dropped badly, but there is still a fair prospect.

Azusa and many other sections are also caught by the charge of return of empties, especially hitting strawberry and blackberry growers.

Highland's oranges are all shipped making a total from that section of 1568 cars. This is more than 300 in excess of last year's shipment.

The Southern Pacific management is giving positive assurance that another season will see plenty of fruit cars for handling Southern California output of oranges.

Five hundred men, women and girls are employed at the Pasadena cannery putting up peaches. It is estimated that 1200 tons of peaches will go through this one house.

Irwindale berry growers are complaining because Wells Fargo & Company are charging for the return of empties, which rule we understand, prevails over the State now.

An orange packing-house at Azusa has installed a huge blower which pumps cool air from the basement through the building, thus giving greater comfort to the employees.

J. J. Miller, a cantaloupe grower in Imperial valley, shipped 537 crates in one day recently. This is said to be the largest number that has ever been sent by one shipper in one day out of that valley.

Commissioner Pease, of San Bernardino County has returned from an inspection of the White Fly pest at Marysville. He reports that the people there have given most thorough attention to wipe out the pest.

Two trees in the Redlands lemon grove have supplied their owner with \$42.12, or \$21.06 per tree. It is up to the real estate men to figure on what one little ranch of ten acres will bring their owners and begin selling real estate on the basis of the product of those two trees.

The long desired wrapping machine for oranges seems to have materialized for one of the packing houses in Redlands and a machine has been installed to wrap all oranges that pass through the house. The machine simply wraps, the packing being done after the wrapping has been done. It is said to give uniform wrapping and to be a time saver.

AGRICULTURE.

Improvements in the levees in Yolo county are being pushed.

Pomona grange held an all day session at Santa Rosa last week.

Stanislaus county is making an effort to hold a county fair this fall at Modesto.

The creamery men's convention will be held in Davisville, November 21st to 23rd.

Representatives of a large beet sugar concern are examining soils in Sutter county.

Fresno county supervisors have granted a \$2000 appropriation to aid in the County Fair.

The Sacramento Drainage Act has been declared valid by the Superior Judge, G. W. Nicol.

Prof. W. T. Clarke is back from his Alabama work and again occupies a chair in the State University.

The Kings County Poultry, Pigeon and Pet Stock Association is to hold its show on November 26th to 30th.

Twenty costly prizes is the sum total of the offerings to be made at the Irrigation Congress at Sacramento.

Twenty-seven and a quarter cents per pound were paid by the Humboldt county creameries for early July delivery.

There is friction between the dairy-men and the creameries of Hanford as to the price to be paid to the producers.

The big canning company of the Pacific Pear Packing Company, of Oakdale, is putting up a big pack this year.

Secretary Howard, of the Hanford Fair Association, says "that a big Fair is on." Hanford always has a good fair.

Fresno consumers claim that the combination of the creameries compels them to pay excessive prices for dairy products.

The Laton Co-operative Creamery Company claims an average price paid to producers of thirty-one and eight-tenths cents.

A farmer burning weeds from an irrigating ditch, near Ceres last week, let the fire get beyond his control and burned about fifty tons of hay.

It is estimated that three hundred thousand acres of land will be reclaimed from Tulare Lake by drainage operations now under consideration.

Many valuable samples of new grain and important records were destroyed in a fire which occurred on an experimental grain farm west of Yuba City recently.

Valuable timber has been burned in Kern Cañon, near the Edison Electric Company's plant. Over fifteen hundred acres of timbered land being covered by the flames.

Farmers along the Sacramento and San Joaquin rivers are compelled to pay \$1.00 higher freight rate than formerly, on steamer freight carriers. This is claimed to be due owing to the excessively large crop.

The Gulala bridge near Ukiah was destroyed last week by a drove of cattle which stampeded near the middle of the bridge which caused one span to collapse killing part of the cattle. The cattle drover is to commence suit against the county.

HORTICULTURE.

Hanford peaches are ripening rather earlier than usual.

Prof. Ralph E. Smith is inspecting orchards at Dinuba.

Vacaville is selling prunes at \$40 per ton on the trees.

A new cannery has been completed at Gilroy and is now running on tomatoes.

Seeded prunes are now being shipped in one pound cartons from Visalia.

Peach men are wondering at the amount of sulphur which they may use in sulphuring.

Turlock streets show a busy scene with melon wagons plodding through them these days.

First full car of melons was shipped from Turlock last week. It went to Chicago.

One steamer carried four thousand crates of plums from various places along the Sacramento river in one trip.

Tulare county Board of Trade has secured a fine location at the State Fair for its contemplated "prize winner."

Kings county superintendent of schools has been besieged by children for certificates entitling them to work in the canneries.

The railroad company has taken a hand in closing the break in the Buena Vista levee, and it is thought it will soon be accomplished.

Some go as far as to make the claim that the white fly at Marysville has been completely eradicated, but this is a case which will bear watching.

San Francisco Bulletin estimates the dried fruit output of this State this year at \$15,000,000, canned fruit at \$14,000,000, walnuts and almonds nearly \$2,000,000.

The recent warm spell ripened the table grapes at Lodi earlier than was anticipated. It is estimated that the grape crop will be thirty per cent short of the average.

Plum trees in a certain orchard near Yuba city are making a net return of \$10 to \$13, and it is claimed many large orchards will average \$500 to \$600 per acre this season.

D. E. Sprott, manager of the Tulare County Fruit Exchange, is inspecting the orchards of the Tulare county citrus belt, and announces that the coming harvest will be an average one.

A farmers protective association has been organized in Sutter county. The officers are: W. P. Crozier, president; C. W. Thresher, vice-president; L. A. Keith, secretary; and R. A. Cowee, treasurer.

The following five men are representatives of Fresno county at the Irrigation Congress: Lucius Baker, John Fairweather, D. S. Snodgrass, C. B. Shaver and John S. Dore. There was a strong contest on the appointment of Mr. Dore who finally won out easily.

It is estimated that seven thousand trees and plants have been defoliated and destroyed in the city of Marysville to wipe out the white fly pest. A total cost of inspectors and legal services has been \$8500, while the work to owners, to city, and others, has been about \$3500.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yelo Sts., San Francisco, Cal. Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

STATE FAIR.

LET US consider the many advantages of exhibiting at the early fall Fairs, especially the California State Fair, held at Sacramento, Sept. 2 to 14. There we meet people from, not only California, but the surrounding States, who come to exhibit, to see what others exhibit and to buy breeding and exhibition stock for the coming breeding and show campaign.

If you have never shown only in your local show, get your birds ready and take them to Sacramento, as the educational feature alone will pay you for your trouble. Many have good birds (or think they have) who only attend some local show, never having had the advantage of showing with, and comparing their stock with successful breeders from other sections.

The Fair Association is offering very liberal cash premiums this year to encourage the breeder and will no doubt be the means of bringing together breeders from all parts of this and adjoining States. While September is a bad month for a show on account of our old stock being in the molt, yet we have the same chance as our neighbors.

Premiums Offered.

On all recognized standard varieties of poultry, turkeys, pigeons, geese, ducks, guineas, capons and ostriches liberal cash prizes will be paid, whether there is competition or not, provided the specimen exhibited is considered worthy by the judges.

The prizes on cocks, cockerels, hens and pullets are \$1.50, first; \$1.00, second and 50 cents for third. Breeding pen, to consist of one male and four females, \$5.00, \$3.50 and \$1.50.

Bronze, Narragansett and White Holland turkeys are granted \$4.00, \$2.50 and \$1.00 as premiums; while Buffs, Slates and Blacks are the same except that the second prize is \$2.00.

In ducks Pekins, Aylesburys, Rouens, Cayuga, Indian Runners and Mascovy all command, \$4.00, \$2.00 and \$1.00 premiums; and in the same breeds the best pair under six months is granted \$2.00, \$1.00 and 50 cents in premiums. Gray Colls, White Colls, East Indian and Crested Whites are each granted \$3.00, \$2.00 and \$1.00 premiums.

Toulouse, Embden, Brown Chinese and White Chinese are offered \$4.00, \$2.00 and \$1.00 premiums; the Gray Africans, \$3.00, \$2.00, \$1.00 while the Canada and Egyptian are granted only first and second—\$2.00 and \$1.00.

Guineas, Whites and Pearls are offered as first, \$2.00, and \$1.00 as second.

Best display of Capons, not less than five specimens competing, \$3.00 for first and \$1.50 for second.

All pigeons, best pair \$1.50, \$1.00 and 50 cents.

Best display of Ostriches, \$75.00, second \$35.00.

In sweepstakes there are premiums of \$12, \$6, \$3, for best display of any single variety (not less than 20)

one exhibitor; also same on best American class Asiatic, Mediterranean, Bantams, games and ducks. Also grand prize of largest and best exhibit of any breed of \$20 for first and \$10 for second.

Incubators and supplies are to be awarded premiums for display only. On this point the management says:

It being, in the nature of the case, practically impossible to satisfactorily test, during the Fair, the different kinds of incubators manufactured, and any award for "the best incubator" being certain to cause well-founded complaints of unfairness, no prize will therefore be given for the best incubator, but only awards made for displays, etc., about which there can be no question of injustice.

On these displays there is offered for best display of incubators in operation, Gold Medal or \$20.00; for the incubator hatching the greatest number of chicks during the show, \$10.00; best display of brooders, \$10.00; best display of poultry houses, \$10.00; best display of poultry fixtures, \$10.00; best display of incubators and brooders combined \$10.00; best display of poultry supplies, Gold Medal; second best, Silver Medal.

AROUND THE YARDS.

Feed well during the molt. Not a fattening food, but a food that will give strength and promote vigor.

Clean the nest regularly and keep the vermin down, encourage the hen with nice, clean inviting nests.

Fresh water, shade and clean quarters are necessary to insure the health of your flock.

Geese are profitable and hardy, if you have range and green food.

Hens that are poor layers should be sent to the butchers, as it would be cheaper to give the non-layers away than to keep them to eat up the profits of the ones that do lay.

The slow-feathering fowls are usually the hardiest, as the drain on the system occasioned by quick feathering does not weaken them.

Crop-bound fowls can trace their trouble to lack of gravel or sharp, gritty material as well as to fibrous substances, such as potato and apple parings or grass blades.

Persons who have applied themselves to studying the habits of fowls soon become aware that attending to their general comfort—that is, looking after them properly—is of much more consequence than merely feeding them. This is the reason why the French are so prosperous with their poultry farming; they grudge no time to see to the well-being of their stock, and in the end it fully repays them for the care they have taken of it.

How do you tell the full-blooded Indian Runner ducks? I have different colors in the Indian Runner breed, some light and some dark. Which are the best for laying?

What is a good way to mark young pullets, which I want to keep for next year layers?—R. C., Long Beach.

There is no way of telling positively, as to whether your ducks are pure Indian Runners. You can tell gen-

ally by the color. Yet a duck that two-thirds or one-half Runner may have the color of the pure bred. Should you breed a cross, the foreign color would crop out in the offspring. If you get your stock from some reliable breeder, no doubt they are pure bred and still be a difference in color. The color, however, has nothing to do with the laying qualities. The standard color for Indian Runners is, head light fawn, or gray and white, fawn preferred; cap and cheek markings, light fawn or gray. Bill, yellow, spotted with green when young; green when fully developed with black bean Neck, white from head to where breast markings begin, which should be about one and one-half to two inches from base of neck. Back, light fawn or gray. Breast, light fawn or gray, evenly divided about half way between point of breastbone and legs. Body and fluff, light fawn or gray, even throughout; fluff, white except an indistinct line of color which runs from base of tail to thigh. Wings: The shoulders, top part of wings and tail same color as breast, and the color should be the same shape of a heart pressed flat on back. Tail, light gray or fawn, which in drakes is a trifle darker than body color.

Punch the web of the foot of birds you wish to distinguish, with a small punch which can be obtained from your poultry supply house.

Head Lice.

Will you kindly inform me what ails my turkeys? They have been wing occasionally, in the past eight weeks and up till now I have lost 16. Their symptoms are, drooping around for a few days, slightly noticeable; they then get worse and won't eat; seem to have spasms before they die as they flop around and act as if in pain. Their droppings are of a greenish yellow cast. It takes them about the age of six weeks or two months. I give them plenty of grit and charcoal. Their feed is mostly corn and curd, mixed quite dry. I give them chopped parsley, onion and oat leaves; wild lettuce and kale.—
J. E. S.

We think the trouble with your turkeys is head lice, as head lice will kill turkeys at this age. From our letter, we think you are giving them good food and don't think this the cause, unless they get something you did not speak of. Make a special search for head lice; grease the top of head with a little lard or vaseline at night, care being taken not to use too much.

BIRDS THAT LAY AND WIN.

In the mind of the average person, poultry culture is divided into two widely different fields, which have no vital and intimate relation. A great many people who keep a family flock and even some of the large utility breeders consider that the fancier has nothing in common with them; that money spent with a fancier for stock or eggs is wasted. In other words, they think the breeder of fancy poultry is a parasite or blood-sucker. This is not only true of those who have had no dealings with poultry specialists, but also with some who have exchanged good money for bad birds. Not bad birds from the few point of some fanciers, but worthless for all practical purposes. It is against this kind of birds and those who breed them that we raise our voices. They not only injure those who buy of them but also discredit all other breeders.

There are honest fanciers. We are

not measuring all of them with the same yard stick. A great many good, honest men and women are in the fancy, who are aware of what poultry must be to be of real profit outside of the show room and are bending every energy to develop their chosen breed or breeds to their highest possibility, not only as show birds, but as practical money-makers.

Mutually Helpful.

The fancier should be, and is in most cases, a great help to utility breeders, who form the great backbone of the poultry business. He is looked upon very much as we look upon specialists in other lines. Their valuable discoveries and improvements are accepted because they are in advance of the ideas and methods we have had formerly. In the same way, the poultry specialists who give their time and thought to careful selection and mating of the finest specimens of the various breeds, in order to make them more profitable as well as attractive, gain the respect and confidence of the poultry world.

The fancier is the salt of the earth as far as the poultry business is concerned. He spends a great deal of time and money experimenting and thereby brings his special breed up to a higher plain of usefulness and beauty. His flock is carefully culled and only the choice specimens go to make up his breeding pens. Exceptional layers alone are used and thus he builds up a strain of great layers. The utility breeder buys his breeding stock of such a fancier and is pleased because he gets not only fine looking birds, but also birds that will raise the egg-producing powers of his flock. In this way, the fancier develops a flourishing trade by not only feathering his own nest, but also by making it possible for the other to profit—the fellow who has neither time nor the means nor the skill to enter into the intricacies of line breeding, exhaustive trap-nesting and the careful study of individual birds and their proper mating.

"Handsome is as Handsome Does."

Shape, color, carriage, etc., are not enough. Do your hens lay a profitable number of eggs? Is the average egg yield of your thoroughbred flock above that of ordinary barnyard fowls? The egg-producing quality of your birds should be very high so that those who have birds of your breed may profitably introduce new blood from your strain. If this be the case, you may consider yourself one of the fraternity of poultry fanciers. On the other hand, if you have succeeded in building up a flock that is able to pull down the blue ribbon at every poultry show, but of whose egg record you are justly ashamed, you are a failure and not a fancier, whoever you may be.

Must Have Eggs.

The utility breeder wants eggs and he will have them. If you have birds that are prolific layers, you get his trade, if not, he goes to some one else. Don't flatter yourself that you can fool the people. You remember what Lincoln said: "You can fool all of the people part of the time, and part of the people all the time, but you can't fool all the people all the time." "Be sure your sins will find you out," and you will be out of business. The hen's very excuse for being is to lay, so don't deprive her of it by foolish breeding.

Culling.

No matter what breed, by carefully

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

Silver's Clover Cutter

For Poultry

This machine will cut clover, alfalfa, straw, vegetable tops and similar material, green or dry, into $\frac{1}{4}$ inch lengths, which makes it especially adapted to cutting feed for poultry. It is all iron and steel, consequently very durable. Length over all, 24 inches. Size of feed box, 18 inches long by 10 inches wide at rear end, by 8 inches at throat. Feed rollers are full width of cutting surface. Has 8-inch, 4-bladed, solid center, spiral knife, with adjustable cutter-bar, like a lawn mower. Capacity is a bushel of cut clover in 10 minutes or less. It is intended to be mounted on a bench or box to make it right height for operator.

When writing advertisers, mention Cultivator

culling of non-producers as well as of those inferior in standard qualities, you will in time have a strain that will be an honor to you and to the trade. Breeders everywhere are coming to realize that there is more in individual strains than in breeds. Of course, there are some varieties whose natural advantage lies in the production of large numbers of eggs and it is easier to reach the 200-egg mark with such a breed than with those which tend to be flesh producers. However, no one breed has all the good points cornered, so we should be careful about trying to make it appear that ours is the only profitable fowl.

Be Honest.

But whatever the variety be which has taken your fancy, be honest with it and to those to whom you sell. Give 100-cent values for every dollar, and be sure the hens lay.

There are some who need for exhibition, thinking they must close their eyes to everything except the requirements of the standard—that when they have produced a fine show bird there is nothing more to do. Those who thus divorce standard requirements and utility make a great mistake. Perfect specimens, to our minds, must be more than show birds or layers. They must be both of these, also hardy and capable of producing a uniform offspring.

In proof of the fact that show birds do lay, you will pardon a personal experience. Our best layer, as shown by the trap-nest, is the hen that has won third prize twice in succession, in the last two Los Angeles shows; she is closely followed by hen-winning first at the late show, and she in turn by others of our best exhibition females. This proves to our satisfaction that show birds are good layers if properly bred. And why shouldn't they be excellent layers? They are the most nearly perfect specimens in all other respects and should excel in real usefulness. All honor to the "Birds that Lay and Win."—H. A. Wheeler of Perham & Wheeler, Lordsburg.

BREEDING FOR MORE EGGS.

In an experiment begun nine years ago the Maine Agricultural Station has been increasing the egg laying capacity of its poultry. The first year 52 trap-nests and 140 pullets were employed. The work has been extended until now 200 trap-nests are in use by 1000 hens. By the trap-nest it is possible to know the exact daily work which every hen is doing.

In one year forward from that date the 140 birds laid an average of 120 eggs each. Twenty-five laid over 160 each, and less than 100 each. Hen No. 36 laid 201 eggs; No. 101 laid 204, and No. 286 laid 206 eggs. The eggs of No. 36 were light in color and she was therefore rejected as a breeder.

At the commencement of the next breeding season, 1900, Nos. 101 and 286 were mated with males that were unrelated to them, or to each other. The cockerels raised from the eggs of these two birds were the first males produced for use in this work. In the early spring of 1901 several sons of hen No. 286 raised the previous year, were mated with the 24 two-year-old hens that laid 160 eggs and over each during 1899, and 25 others that laid 160 or over during the 1900 test.

No female has been used in the breeding pens for six years whose mother did not lay at least 160 eggs in her pullet year. No males have been used as breeders unless their mothers laid about 200 eggs per year.

The breeding pens are now filled with birds of both sexes that have six generations of mothers and fathers before them that were bred under these rigid rules of selection.

The stock commenced with in 1893 had been laying about 120 eggs each per year for several years, as shown by the flock records. During the last two years the hens have averaged 144 eggs each during their pullet year. The producing capacities of the hens have been increased about two dozen eggs per year. Perhaps this increase is not all due to the selection and breeding. The dry feeding and open air housing doubtless have contributed to the improvement. Not a drone or small producer has had a place in the breeding of these birds in six generations. During only one season, and then with but two small pens, have birds as closely related as cousins been bred together. Line breeding is followed, the matings being only with distantly related birds. The birds are vigorous, of good size, and able to stand up under hard work. They have good, large yellow beaks. They are well feathered and barred, but they are not bred for the fanciers or the show room.

PRODUCING THE LAYING HEN.

When the chicks first come out of the shell, I leave them in the incubator till the last hatched is 24 hours old, then remove to a brooder with temperature of 90 degrees, the brooder floor being first covered with a thin layer of sand and one inch of cut alfalfa, and give grit and water two hours before feeding. I feed a dry grain chick food containing 20 per cent chick grit and 5 per cent small granulated charcoal. The brooder is cleaned every day by sifting sand through a cornmeal sieve. Beef scraps are kept before them after they are four days old. This is their feed till they are six weeks old when they are given free range and are fed but three times a day, corn being mixed with their food. One part cracked corn, one part wheat, three parts ground oats in bulk with fine meal sifted out. I always feed in a litter to keep them busy.

When they are four months old, I feed one part corn, one part wheat, one part barley and two parts oats three times a day with coarser charcoal in the same proportion or fed in hoppers always before them. At five months old I begin feeding one part corn, one part wheat, one part barley and two parts oats three times a day with coarser charcoal in the same proportion, or fed in hoppers always before them, with green stuff of some sort always near. Steamed cut alfalfa and cabbage are best in winter. In rearing laying chickens it is most important to keep them growing all the time and always busy. Nothing ever has been or will be profitable brought up in idleness.

By following the above regimen and attending to proper cleaning of the chicken houses, destroying all in-

ferious vermin, insects, etc., and using scrap meats exclusively. I have reared chickens that have no superiors in laying qualities. I do not breed for yearly records, want eggs only from November 1 to March 1, and I select none for breeding that do not lay at least 150 eggs that period. In selecting my breeders I weigh their breeding, laying qualities and standard points.—H. Rankin in American Agriculturist

PRESERVING POULTRY MANURE

The preservation of the droppings of the fowls in the summer is a difficult matter, as the poultry manure rapidly decomposes, and gives the poultry house a very disagreeable odor. This cannot be well avoided when the house is thoroughly clean but the manure can be so treated that it will not only be of great value but will also lessen the disagreeable odor to a certain extent. The roosts, of course, should be so arranged that droppings will fall on a platform. Keep the platform well covered with dirt (which has been sifted) to a depth of about half an inch. To this, first scatter the dirt, and then over the dirt scatter a handful of kainit (German potash salts) which will arrest the escape of the ammonia when decomposition begins. Two or three times a week (daily is better) sweep the platform with a broom after that is done sprinkle the platform and the floor with a solution of a tablespoonful of carbolic acid in a gallon of water, and use dry dirt on the platform on top of this. A well-known Douglas mixture, composed of one pound of copperas to four gallons of water, and one ounce of sulphuric acid, is also an excellent disinfectant, and a very cheap one, that can be used freely. No ing parts with ammonia sooner than poultry manure, and a very short period is necessary for the manure to deteriorate. In the process of drying the evaporating moisture hastens the loss of volatile matter. The fat acids are capable of forming compounds which results where the droppings are kept moist with soap suds (for they must never be allowed to become dry). During the time these changes are occurring in the mass the insoluble portions are reduced, and the whole rendered more available as a plant food, as well as retaining value as a fertilizing agent. Plaster muck, fine dirt and sifted coal ash may be used as absorbent material.—Colman's Rural World.

Coulson's No. 3

Condition Powder For Poultry

If you are not already using Coulson's No. 3 Condition Powder, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season.

If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

We Claim Coulson's No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in.

We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are now beginning to molt heavily, their combs are as bright and red as at the beginning of the season.

You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably.

Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want it.

Where the local dealer does not keep it, we will make you a **SPECIAL OFFER** to deliver it freight prepaid to any Railroad Station in California, at the following Prices:

10-lb. Package, \$1.50; 25-lb. Package, \$3.25; 50-lb. Package, \$6.00; 100-lb. Package, \$11.00

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW and insure yourself lots of eggs when prices are high.

Failure of Cow.

A cow came fresh three months ago, she is fat and eyes are bright. She gives only a couple of quarts of milk daily. She has always before given, on the same food, alfalfa hay, six quarts of a mixture of one part corn meal, two parts rolled barley and five parts bran, about six gallons of milk daily. We fear she has been spoiled by poor milking can we do anything now to increase the milk flow?

Give this cow a quart or more of bran well wetted and salted sharply, make it as sloppy as she will eat it. Add to the water each time until it is like a soup. Give the bran slop night and morning, increase it if desired as it cannot do any harm to the cow. At noon give her an ounce of anise or fennel seed mixed with a pound of rolled barley, a pound of bran, and half a pound of oil cake meal. Do not increase the amount of oil cake or aromatics for if you desire to feed more heavily do it; by increasing the bran and the barley in the proportion of one part barley to two of bran. Give her some hay with the grain or else her digestion will be-

mouths. If no foxtail are found that can be removed, it may be necessary to take them to the doctor for deep-seated ones. I have a young horse that required a probing and forceps ten inches long to remove one from his nose. He coughed and choked and quidded the food in his manger. He also had two teeth that needed to be repaired. Now if you cannot discover foxtail, then try for strangles by grasping the horse under the throat close up to the head; if he flinches and chokes it is sore there. Apply a mild blister on the outside and use molasses and chlorate of potash in the mouth, putting it in with a wooden spatula several times a day. The strangles should be taken care of even if not serious, as they often affect the wind of the horses.

Three Horse Evener.

The Cultivator is in receipt of several answers to the recent query of M. C. S., Rialto, regarding a three-horse evener with no side draft. Perry Lewis of Tustin sends in a sketch

A Three Horse Evener

come clogged. Grass will not answer with this heavy feed. As soon as the milk flow returns begin to cut down on the feed without you find it pays to feed her.

The udder needs the mechanical effects of friction. After milking her clean, put a little vaseline on your hands and then take one quarter of the udder raise and press it gently up with the palms of the hands, let it down and repeat ten or twelve times, then roll the quarter pressing it outwardly then into the rest of the udder, doing it all slowly and gently with the open hands. Work on each quarter a couple of minutes and then milk out the collected milk. Repeat three times, the first time you will only get a little milk, but as the protien food she is receiving is milk-making, the udder as it softens up will respond and the increase will come rapidly.

Strangles.

We had our horses in pasture for some time. Now one of them has a bad cough. She acts as though she had something that was irritating her throat and she must get it out. Others in the pasture are the same. They eat well, hold up their heads and their eyes are bright. Some of them cough all night. The fattest horses in the pasture are affected. Could it be possible that they have a foxtail or some other foreign substance lodged in the throat? They do not run at the nose. Their mangers are spattered with small particles of straw that they cough up.—Mrs. J. H., Watsonville.

I would catch up these horses and examine their throats, noses and

with the most complete figures of any we have received. From his sketch we have made the accompanying engraving.

The notes as to measurements which Mr. Lewis sends are as follows:

Two feet from 1 to 2; one foot from 2 to 3; one and one-half feet from 4 to 6; six inches from 4 to 5; six inches will do from 2 to 4. Get your pieces straight and measure distance from 3 to 5. Have square holes cut in irons for bolts, so they can be easily removed. In this cut the high horse walks next to tree; should you wish to drive the off horse next to the tree you can reverse the plan. You must place the double-tee part back six inches from the place where you would hitch two horses, or shorten traces. I am using one on a disc and do not notice much side draft.

Shepherd's Papers.

Will you please publish the address of the paper called the Shepherd's Guide, or any other good paper or sheep.—E. A. P., Cordelia.

The only sheep papers we recall are the American Sheep Breeder Chicago; and the N. W. Live Stock and Wool Growers' Journal, Pendleton, Ore. In general stock papers there are many like the Breeders Gazette, Chicago; Live Stock Journal Chicago; Stockman, Chicago; Live Stock Review, Cincinnati and National Stockman, Pittsburg.

Twenty-four thousand hunter's licenses have been granted in this State during the month of July.

THE MODERN MILKING MACHINE.

Continued from First Page

expression of surprise that a work which has so long been considered necessary to be performed by the man hand, can be so satisfactorily performed by this simple machine. Of course, those of us who had never seen this operation before were full of questions. Notwithstanding that Mr. Houston was pressed to finish his work, he most courteously gave his time to answer various questions which we were not slow to propound to him. This particular machine has been in operation in this dairy for a little more than nine months and is working today as well when it was new, nearly a year ago. The only expense it has occasioned for repairs, has been for the rubber disks in the opening of the receiver. This, of course, is merely nominal as they cost five cents each or not to exceed a total of 50 cents per month for one machine. With the one machine Mr. Houston milks each morning and evening forty cows, although at this particular time the number falls slightly short of that. To milk forty cows requires, with the carrying away of the milk, the waiting upon and weighing the milk for other milkers, about two hours time. This would be about twenty cows per hour which Mr. Houston said was easily performed on an average. Bear in mind, this when the operator also weighs and cares for the milk of others. In this case he carries to the milk room a hundred and fifty feet away. When the machine only is operated and all time given to it 26 cows per hour can be milked. Or, from another view, within the usual three hours 60 cows is a fair number for the one milker to care for.

Some cows, of course, are milked much quicker than others, but invariably quicker by the machine than by hand. Incidents were mentioned where cows which had required twenty minutes to milk by hand were milked thoroughly and cleanly by the machine in two or three minutes. We say cleanly advisedly, for no "stripping" is necessary.

Of course, we asked the question as to whether there was fun doing at the time of the "breaking in" of the cows and were given the information that with some, the process was very simple; they seemed to take to the machine almost as if it were the natural method, but ordinarily it was no more work to train a cow to the use of the machine than to "breaking in" the heifer to the hand-milking method; so that when a beginning is made with the heifer, and she has nothing to unlearn, it is comparatively easy.

Naturally another question, which springs to the minds of all who see the system of receivers and rubber tubes is, "but can you keep the machine, inside those tubes thoroughly clean and sanitary?" In this respect we think the custom at this dairy is: After the night milking, the receivers are placed in a pail of pure water and the water is pumped through with force for a few moments. Preceding the milking next morning, the same is done, and after the morning milking the various parts are thoroughly cleansed with sal soda solution, all very simple and quickly done. With ordinary attention it is the sanitary method of milking.

Another one of the questions which will concern the ordinary milker is as to the initial cost of the machine which, of course, must be considered as one of the factors in any improve-

ment, but with that and the still stronger factor is this question: How much will it save? This will help progressive dairymen to arrive at the decision as to whether he will invest in such a machine. This particular machine which we saw so successfully operated is the Mehrling Foot-Power Cow Milker handled by the O. J. Weber Co., of Los Angeles and costs ready to operate \$110.

Now then, \$110 for a machine which will milk twenty to twenty-six cows an hour and at the end of nine months is in as good condition as when new; has paid for itself several times over and we believe, is a wise investment for any dairyman. Of course, a fairly intelligent man must operate it, though we have heard the statement that a ten-year-old boy of ordinary intelligence could handle the machine. This might be, but from our inspection think that they should not be placed in the hands of the more ignorant farm laborer. But even then the independent position in which the dairyman is placed, by owning this appliance, is a strong factor to be considered.

San Diego County Live Stock Men's Association, at their last meeting, adopted a constitution and by-laws in which the object was stated to be to create and promote livestock interests in San Diego County, securing the enactment of judicious legislation, exterminate contagious diseases of animals and create more fraternal feeling.

General Manager Woodford, of the California Fruit Growers' Exchange, says that the fruit industry will be ruined unless fruit car distribution is put on a different basis than at present.

Iowa is said to produce six hundred carloads of popcorn per annum returning to growers over \$85 per acre. Calhoun and Sac counties are the center of the industry, which started five years ago. One grower has had over 300 acres, yielding 40 to 60 bushels an acre, worth on the ear \$1.50 to \$1.75 a bushel. It is planted late in the spring and harvested before field corn, the huskers getting 20 to 25 cents a bushel. The corn is shipped in the car, and so reaches the wholesaler. One grower shells his corn and puts it up in 10-cent paper packages for Omaha and Sioux City houses. This year he will plant 600 acres, build a packing-house and employ girls to put up the corn.

The Farmers' Union, now more than 60,000 strong in Mississippi, is making a determined effort to have cotton-bagging supplant jute, and the managers declare they are meeting with great success—a great many orders having already been received for the cotton wrapping. This will produce a market for a great many thousand bales of inferior grade cotton, and really, there does not seem to be any good reason why the cotton producer should send to the Philippine Islands for his bagging.

The Orange County Poultry Association held its first annual banquet in Santa Ana last week. The bill of fare was chicken in every style from fried, roasted, boiled and fricaseed on down. Nothing but chicken was served. After the banquet much crowing was heard about the table.

Watsonville Board of Trade has a collection of entomological specimens of which it is proud.

Studebaker Wagons

No one ever claimed to build a better wagon than the Studebaker.

Why?

The originator of California Wagons was Mr. J. M. Studebaker, President of the Company, who worked as a wagon maker when in his shop in the mines in this state.

They last longer and run easier than others because he designed them to withstand the peculiarities of our climate and proportioned them properly to carry the heavy loads common to this section.

Our stock is complete. We can furnish wagons of suitable size for any work. Let us show them to you at our salesrooms,

Kellogg's Ant Paste

Lompoc, Cal., July 19, 1906.

Mfr. Kellogg's Ant Paste:

Dear sir—I have been tormented with ants for years and they seemed to get worse every year. I saw your ad in the Cultivator and sent for a bottle tho' I admit I hadn't much faith in it. In fact, kept the bottle in house a week before I tried it. One afternoon I used the Ant Paste according to directions and the ants didn't pay much attention to it and I thought it was a failure like everything else I had tried, but next morning there wasn't an ant in the house. I could hardly believe it. It seemed like magic. I wish every one bothered with ants could hear of and use Kellogg's Ant Paste.

Mrs. Francis Burbridge.
Note to Druggist—You can get this from your Supply House, or write to the manufacturers,

1010 E. Ninth St., Los Angeles, Cal.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

Household Department

WHINEYBOY AND SMILEYBOY.

Little Mr. Whineyboy came to town one day,
Riding on a Growlygrub, screaming all the way,
Howlyberries in his hat,
Screecher leaves atop o' that,
Round his neck a ring o' squeals,
Whiney Whiners on his heels.
What do you think!—that awful day
Everybody ran away!

Little Mr. Smileyboy came to town one day,
Riding on a Grinnergrif, laughing all the way,
Chuckleberries in his hat,
Jolly leaves atop o' that,
Round his neck a ring o' smiles
All of the "very latest styles."
What do you think?—that happy day
Not a body ran away!
—St. Nicholas.

TOMMY AND THE TIGER.

TOMMY had been left alone in the house. His father and mother were called over to his Uncle Jirah's, seven miles away. His Uncle was very sick.

Tommy would be alone all day. Perhaps his mother would stay at Uncle Jirah's that night, but his father would surely return before dark. Tommy was quite sure he wouldn't like to be alone after the shadows came. He didn't mind it at all while the daylight lasted, but the night was something different.

Tommy hadn't been well. The doctor said it was malarial fever. That was why they didn't take him with them to Uncle Jirah's. He was better off at home, and he was so nearly well that it was quite safe to leave him.

"You will be a good boy," said his mother, a little anxiously as she put out the milk in a blue pitcher and the creamy bread on a blue plate and a saucer heaped up with cookies he liked best.

"Yes'm."

"And not play with the matches?"

"No'm."

"And you won't be scared because you are alone?"

Tommy's father frowned. He let his hand rest lightly on the boy's head.

"Tom's a little man," he said. "There's nothing that can frighten him."

That was very sweet praise. His father was not given to remarks of this pleasing sort. The care of a farm that was but fairly productive had taken most of the sentiment out of Ezra Crandall's life. But he was very fond of Tommy in his quiet way. And Tommy particularly liked to be called Tom. It had a much more manly ring than Tommy.

So the older Crandalls drove away and Tommy Crandall was left alone. After they were quite out of sight he went back into the house. It suddenly seemed very empty. He remembered that it was the first time he had ever been left quite alone. A little lump came up in his throat.

"Tom's a little man," was what his father said. "Nothing can frighten him."

He stiffened up and walked through the lonely rooms, whistling gaily. When he reached the kitchen he looked longingly at the pitcher of milk and the white bread. Then he glanced at the old-fashioned clock on its little shelf above the stove. It was only eleven. He would be a man and wait until noon for his luncheon.

Tommy was just eleven himself, and an excellent scholar for his age. His mother had taught him to read, and to read very well. Tommy's mother was a school teacher when she married his father, and it was her delight to impart knowledge to this favored pupil. She knew his books would furnish him choice entertainment during that day of lonesomeness.

Tommy went to the book shelf in the sitting-room and took down Robinson Crusoe. It was shady on the front porch and the little rocking chair he particularly liked was there.

Just before he sat down to his literary feast he stretched himself up on his tiptoes and looked into the valley toward the village, a little more than a mile away. Yes, he could just see it—the top of the white tent and the tall poles with their gay flags. It was a circus, and Jim Hardy said it was going to be a mighty good one. Jim knew. He never missed a circus.

"It's good both ways," said Jim with the air of a seasoned critic. "The animals is first-class, but they ain't no better than th' circus. An' they've got Pete Slicer, th' best clown in th' bizness."

Tommy sighed. He had never seen a circus. His father didn't believe in them. He had told Tommy they were wicked and a waste of time.

The boy opened his book at the right place and was soon lost in the fascinating pages.

Presently he looked up. A confused murmur of voices drew his attention. A number of men and boys were coming up the hill. The crowd was led by a man in a light wagon who was driving a glossy black horse.

Tommy closed the book and ran down the walk to the gate in the hedge. The party had halted in the roadway. The man with the black horse was standing up and looking about the fields. He had very black eyes and a huge black hat and a fierce black mustache.

"She'll sneak for the woods the first thing," he said, and he pointed ahead to the grove a half mile away. "We've got to surround her an' drive her in. An' now you fellows listen to me—more especially you fellows with the guns there. I wouldn't give a tinker's tuppence for the tiger dead, but I'll hand any man that lands her alive an' kickin' in the highway here, a hundred dollars cash on th' nail. An' to all those who want to help me git her I'll give a choice reserved seat for th' show tonight. But look here—she's likely to be as ugly as sin an' you want to keep a sharp lookout. Come on."

The man had a queer looking whip in his hand and he shook it in the air as he spoke. It was a short whip with a thick lash, and in the box of the wagon Tommy noticed a coiled rope.

The party swept along at a good pace, the black-mustached man leading and presently they disappeared behind the turn in the road by the old culvert.

Tommy slowly returned to the porch, but his mind was too excited to permit him to resume his reading. He understood that a tiger had escaped from the circus and was now roaming about the woods beyond Sam Hilburn's farm. How he would

have liked to join the hunting party! But to leave the house—and perhaps the black-mustached man wouldn't let him come. He didn't see any small boys in the party. Anyway he'd have something fine to tell the folks about when they came home.

He stood on tiptoe and looked over toward the woods. There was nothing unusual to be seen.

Then he suddenly realized that he was hungry. He went into the house and looked at the kitchen clock. It was just twelve. Then he sat down and ate the bread and milk. When he had finished the milk there was still some bread left and his hunger wasn't quite satisfied. There was plenty of milk in the cellar and he took the pitcher and went down the stairs.

The double doors that led to the yard were both open and the roomy cellar was fairly light. But there were dark corners in the forward part, under the big sitting-room and as he drew forward an old chair which he meant to stand in order to reach the swinging shelf, something queer in the darkest corner attracted his attention. He saw two small yellow-green lights there, a few inches apart and as he stared at them they seemed to move slightly.

Tommy stood very still. His heart was thumping hard. He wanted to turn and rush up the stairway. Then he remembered his father's words "Tom's a little man. Nothing can frighten him."

The green lights moved again and something black in the darkness purled softly. Those lights were too big for the eyes of a cat and no cat ever purred so loud.

That's what Tommy told himself as he stood there, his left hand gripping the blue pitcher, his right knee pressing hard against the chair.

Yet it was a cat—a cat of a variety that Tommy had never seen save in picture books. A shadowy bulk came toward him out of the darkness and as it emerged into the light Tommy's mind told him in a flash what it was. The cruel head, the yellow-green eyes, the striped fur—this was the runaway tiger. She must have slipped in through those outer doors.

A cold wave ran over poor Tommy. He wanted to scream, but he held his teeth tightly together.

The huge cat came toward him slowly, the yellow eyes on his face. When she reached him she purred again and reaching out her red tongue licked the back of his right hand. Her tongue was rough and hurt him cruelly, but he was careful not to draw his hand away too suddenly. Then she rubbed her head against his leg, a caress that almost pushed him over.

Her movements were so unmistakably friendly that Tommy's voice came back to him.

"Kitty, kitty, nice kitty," he said and timidly scratched the cruel head.

The tiger purred again and the yawned in quite a dreadful way.

Tommy's brain was working fast. Perhaps the tiger was hungry. If he could feed her it might keep her good natured. He was afraid to try to run away from her. She was too near. He would get her up into the kitchen.

"Come, kitty," he coaxingly said and turned toward the stairs. He was a little surprised to find he could walk. When he reached the lower step she was right at his heels. He mounted carefully and pat-pat-pat the tiger followed him.

Concluded Next Week

HOMELY HINTS.

Stings of Insects.

When bitten by mosquitoes, fleas, bugs, etc., bathe the parts in water or a solution of baking soda. The same treatment is good for bee stings. If the sting is left in the wound it should be carefully removed. If a person is stung in the mouth, hot vinegar or hot salt water may be used as a wash.

Blisters.

No treatment is more prompt and efficacious than fomentations as hot can be borne. Firm compression immediately over the injured place will often prevent discoloration, but hot applications have the same effect. The sooner the heat can be applied the better. Alternate applications of heat and cold are very effective.

The hardest way to pare a pineapple is to keep the fruit whole and peel it from the outside, as one could an apple. A much easier method is to first cut out the blossom with a sharp knife, then cut the pineapple in two and cut the inside out close to the rind. Another easy method is to slice the pineapple crossways in thin slices and then remove the rind from each slice.

If a cereal or vegetable burns while cooking, the usual course of action is to pour the contents of the burned pan into a clean kettle and continue the cooking. Even if this is done the food will often have a burned taste. If the first vessel is plunged into cold water and allowed to remain for a few minutes before pouring the food into the second receptacle there will be none of this disagreeable flavor.

When grinding bread through the food chopper tie a paper bag on the mouth of the chopper and the crumbs will not be scattered about. If a quantity of stale bread happens to be in hand at one time it may all be wound up and kept till needed if the crumbs are put into a covered pail which has a few air holes punched just below the top.

One woman who does her own work keeps a bottle of vinegar on her kitchen sink. After having had her hands in soapsuds for any length of time she rinses them with vinegar. This counteracts the alkali in the soap, helps to remove stains and keeps the hands white and smooth.

If a gas or oil range is used in the kitchen, heat and time will be saved by having a sheet-iron cover made of irons, cone-shaped, with a ring at the point to lift it by. The cover must be large enough to set down over the iron holder. It is good also to cover irons on a wood stove.

A darning needle is rather a small implement to use for breaking ice, but properly managed it will prove effective. Place the point on the ice and strike the needle gently with a hammer.

To remove grease from the kitchen sink and drain pipe use hot water and washing soda rather than lye. The lye is apt to form soap out of the grease and clog the pipe.

The rollers of a clothes ringer may be easily and effectively cleaned by rubbing them with a cloth which has been dipped in coal oil.

A few drops of kerosene on the chandelier makes it take up the dust better, prevents its flying, and brightens the furniture.

UTILIZING FEATHERS.

Many a thrifty housewife, who dislikes to see small things go to waste, can put the feathers from dressed poultry to a variety of uses. Small, soft feathers may be used for making quilts and feathers, if stripped from the quills and cleaned. The cleaning process may be accomplished by putting the stripped feathers into a tub and covering them with cold water in which quicklime has been slackened, using a gallon of water to a pound of lime.

Keep the feathers in the tub for two or three days, and stir them till dry.

KNEW HER CASE AT ONCE.

One of America's greatest physicians was called to the bedside of a grand dame of distinguished name and many millions, who is a leader of American society. But now the grand dame groaned and grunted in her silken bed like and washwoman. The physician examined her carefully. Then he said:

"You must get up every morning at six o'clock. Take for breakfast a cup of weak tea and two pieces of dry toast. From nine to eleven exercise, either walking or sweeping or dusting. At noon, lunch on a slice of cold meat, filtered water and stale bread. Don't sleep in the afternoon; exercise again. For dinner take nothing but a little meat, a vegetable and toast. No sweets, no wines, no social dissipation of any kind."

The eyes of the grand dame flashed fire as she said:

"But, doctor, do you comprehend my position? Do you know who I am?"

"Perfectly, madam," answered the physician. "You are an old woman with a sour stomach."

HELPFUL SUGGESTIONS.

Dainty little heart-shaped pillows are the "latest" for the baby.

The practice of honesty and fairness with children cannot be insisted upon too strongly.

The country is the place for children. It develops patience, resourcefulness and independence.

Never cease to be careful about the things you say in the presence of the children. They are proverbial copyists.

Too little fat or cream in baby's diet will produce constipation; too much, diarrhoea. Strive for the happy medium.

Plenty of sleep, good food, an abundance of water and the daily bath are requirements in all cases of beautifying.

SHE "RAISED" HIM.

A young man, who had not been married long, remarked at the dinner table the other day:

"My dear, I wish you could make bread such as mother used to make."

The bride smiled, and answered in a voice that did not tremble:

"Well, dear, I wish you could make the dough that father used to make."

THE QUICK AND THE DEAD.

Schoolmaster asking the meaning of "the quick and the dead," a small urchin says: "Please, sir, the man as gets out of the way of the motor car is quick and 'im as doesn't is dead."

TROUBLE AHEAD.

Beck (despondently)—"I said something my wife didn't like and she hasn't spoken to me for two days."

Peck (eagerly)—"Can you remember what it was?"

Enjoy the refreshment of a cool drink anywhere

APPELL'S SOUTH AFRICAN WATER BAG

(PATENT APPLIED FOR)

Keeps water cool 48 hours or longer; in sun or shade; no ice; light and convenient to carry. It is a great boon to stockmen, farmers, rangers, travelers, prospectors, surveyors, sportsmen, miners, timbermen, threshing crews, millmen, railroad men, teamsters, boatmen and everyone exposed to dry or warm weather, away from good water supply. Can be carried on the shoulder, hung on vehicle, saddle or tree, or left on the ground—anywhere so it is exposed to the air. Satisfaction guaranteed or money back.

SURE CURE FOR PILES

ITCHING Piles produce moisture and cause itching. This form, as well as Blind, Bleeding or Protruding Piles are cured by Dr. Bosanko's Pile Remedy. Stops itching and bleeding. Absorbs tumors. 50c a jar at druggists or sent by mail. Treatise free. Write me about your case. DR. BOSANKO, Philada, Pa.

Some orange trees near Highlands which have been rebudded to other varieties of citrus fruits are showing a new disease. It is the formation of gum underneath the bud, which has been inserted. It seems to force the bud out of position and sometimes driven out of the tree. The cause of the trouble is not yet known.

Yucaipa valley lands are now being sold to settlers. Some of these lands are admirably adapted to raising of cherries and plums and other fruits that in most sections of Southern California have not been a complete success.

A couple of fruit thieves were apprehended last week at Whittier, in fact, caught in the act of loading a wagon with fruit from one of the packing houses. One promptly confessed and took his medicine.

A fine of \$5 was given to a party in Tustin for taking three peaches last week; a little expensive, but peaches are high this year. The fellow who buys them at the fruit stand doesn't get off much easier.

The Produce Markets

Los Angeles Markets

Butter.

LOS ANGELES, July 31, 1907.—Butter remains stationary or if anything slightly stronger in tone than last week. There is a liberal receipt of Eastern.

Creamery extra.....@65
Creamery first.....@60
Dairy.....@55
Cooking.....@23 1/2

Cheese.

Cal. Young America, per lb.....19
Hand.....@20
California Anchor.....@17
Cal 3-lb. hand.....@20
Northern fresh.....@16 1/2
Domestic Swiss.....@23
Imported Swiss.....@30 1/2

Eggs and Poultry.

Eggs are quoted as last week with market showing slight weakness. Storage are being drawn on and Eastern are in liberal receipt.

Some of the jobbers are selling a little below the 23-cent quotation for candled eggs. On 'Change 23 1/2 cents was bid for case count eggs, and 26 cents was asked.

The prices given are those of the commission man to the retailer.

Eggs local candled.....@28 1/2
Eggs case count.....@26 1/2

The following are average prices which dealers pay to producers for live weight.

Hens per lb.....@13

The city of Pasadena has adopted a system of individual cow records, which are now government inspected. Several cows have been killed, after a tuberculin test, at the instance of the Board of Health.

Orange growers, well satisfied as a whole, with the returns of the year, feel that still better returns might have been had had the car shortage of mid-season not prevented much loss at that time.

Casa Blanca, near Riverside, was up in arms because of theft of oranges by tourists of various grades. It is reported that some even got into the orchards and carried off oranges by the sack full.

The Chino Sugar Factory is now running, using about eight hundred tons of sugar beets per day. The crop will be slightly lighter this year than last, but there will still be plenty of fine beets.

San Francisco Markets

Butter.

Eggs first per doz.....@25
Eggs seconds per doz.....@19 1/2
Eggs thirds.....@19

The poultry market was very dull yesterday there being heavy supplies and no demand except for the medium grade of stock. The receipts of yesterday were three carloads of Eastern stock and the heavy leftover supply of two carloads of Eastern stock made the market overcrowded. There were, however, no changes in the prices.

Potatoes are lower and are in a very large receipt. An unsettled condition prevails which is unexpected.

River Burbanks.....@2.25@2.50
River whites.....@50@1.00
Early Rose.....@1.25@1.50

Vegetables.

The market was rather quiet yesterday, there being little demand. Prices were held steady on all but a few varieties. Green corn was in fairly good demand and the price was held steady. The receipts of asparagus and rhubarb were smaller than for some days but the demand being small there was no change in the price. There was little demand for green peppers, but the price remained steady at unchanged figures.

Fresh Fruits.

There is a good demand for some of the varieties of fresh fruits and the prices are advanced in some cases. Watermelons are in good supply at the price made a little wider in range. Cherries of good quality are scarce and will soon be out of the market. Peaches are coming to hand rather slowly and fruit of good quality hard to be found. Strawberries are in good demand and as the receipts are light the price was advanced. The receipts of loganberries and raspberries are exceptionally light and but few dealers have them.

The Pomona Valley Telephone and Telegraph Company originated in the Pomona Farmers' Club. It began actual business a little more than four years ago. It modestly expected to soon have 300 'phones and it soon had 500, a 1000, 1500 and now has over 2000. Many applications for 'phones are on file. It is a real home company, owned and officered by people in Pomona and nearby towns and settlements.—Pomona Times.

The last Pennsylvania Legislature passed a law to provide for the planting and care of shade trees on all the highways of the commonwealth, in town or country. Why should not public agencies plant trees along country roads?

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Among Business Men

A HANDY APPLIANCE.

The farmer, especially the irrigation farmer, often has use for a good farm level, but as such an instrument is usually considered so expensive that the farmer casts aside all thought of a purchase of one for his own use. But we are told that the one for some time advertised in the Cultivator for the Palace Hardware Co., of San Francisco, is a reliable instrument at a low price. Every farmer can afford and it aids vastly in irrigation and other features of farm work.

This instrument accompanied as it is by a treatise on, "Terracing, Draining and Ditches" may save many times its cost and be a satisfaction as well.

The level is composed essentially of four parts:

1. The tripod, composed of three wooden legs and iron tripod-head.
2. The adjusting-head and plate. The adjusting-head is screwed on to the tripod and carries three adjusting screws for the adjustment of plate to a perfectly horizontal position.

3. The level is a circular casting, with parallel edges, resting in a recess or seat formed in the plate. The casting carries the sight-tube or telescope made of brass, and a tested Stanley spirit-bubble by which the level is adjusted. These parts are provided with all the essential means for adjusting and correcting the telescope sight, so that the level can be tested and its accuracy proved at any time by the same methods used with other up-to-date engineer's level, or by following the directions accompanying the instrument.

4. The target-rod and target is composed of a graduated telescopic or sliding rod with thumb-screw for securing it in any position, and a target of the regular form, which slides up or down on the rod and is also provided with a thumb-screw for clamping it in any position on the rod.

AGRICULTURAL EXHIBIT IN CHICAGO.

Here is something different, yet practical—a permanent exhibition of things agricultural. The idea is to have on daily free exhibition almost anything from husking mits to manure spreaders. This practical idea has been worked out and is now an assured fact.

The exhibition will be held in the commodious new quarters recently acquired by White's Class Advertising Co., 118 W. Jackson Boulevard, Chicago. This company, of which Mr. Frank B. White is President, occupies the entire top floor of the "Electrical Building," corner Jackson Boulevard and Desplaines Street.

The exhibition hall is 88 feet by 50 feet, in the eastern half of the floor. It is light, airy and very pleasant. Each exhibit will be enclosed by a neat metal railing, and be kept in show condition for daily inspection. A special attendant will have oversight of the articles, and will devote his entire attention to explaining their merits and uses, to visitors and purchasers.

An attractive folder entitled, "Would you like to have your goods on display in Chicago at a very low cost?" will be mailed free by White's Advertising Co., to any one.

Our readers, when in Chicago, are urged to visit this novel exhibition.

NEW NITRATE BEDS IN CHILI.

The Chilean Minister of Finance has declared in the Senate that the rumor current in Europe of the impending exhaustion of the nitrate supply was unfounded. He stated that deposits had been discovered at Antofagasta and Topocilla as rich as the original deposits at Tarapaca.

GUNS AND AMMUNITION.

One of the handsomest catalogues coming to our desk, is that of the Wm. H. Hoge Co., Los Angeles, under the title of "Guns and Ammunition." It's a work of art and full of information. Cultivator readers will find it of value, for we note in the announcement:

"As our mail order business increases our facilities improve and have reached that point where you may do business as readily with us by mail as over the counter. If you do not find just what you want correctly described in our catalogues write us, we may have it in stock or can get it for you quickly. When in a hurry or in doubt as to price send in your money, we will return the change. Full instructions as to terms, remittances and shipments may be found in back of catalogue."

It is well worth writing for and if you mention the Cultivator it will be sent without cost.

COMPARATIVE RAINFALL CHART.

Southern California readers of the Cultivator will find much valuable information in a "Comparative Rainfall Chart for Southern California" issued by the Security Savings Bank, of Los Angeles. This is a regular feature with this bank and which each year after the rainy season publishes the chart which now covers a period of 25 years giving each year of rainfall at Los Angeles and comparative averages in Los Angeles, San Bernardino, Riverside, Orange and San Diego Counties.

One feature of it which is good, it may be had for the asking, but it is none the less valuable, and readers of the Cultivator who will write for it will get good returns on the investment.

SOLD A HUNDRED CATTLE FROM A CULTIVATOR AD.

Tribble Bros., of the Enterprise Jersey Farm, Elk Grove, Cal., formerly carried an ad in the Cultivator columns and at its termination wrote:

Please discontinue our advertisement in the California Cultivator. Send us the bill for amount due.

The results have exceeded our expectations. The liner we inserted sold nearly one hundred cows, heifers and bulls. Most of these were for our neighbors.

Yours truly,
Tribble Bros.

BIRDSSELL HULLERS.

For fifty years the Birdsell clover hullers have been standard in America, and since alfalfa has become a factor the company has met the conditions and is today putting out one of the finest, most reliable machines ever used. They are putting out one of the finest catalogues of clover and alfalfa hullers, also automatic feeders and stackers, which is well worth sending for. In its preface they say:

"On the following pages it is our purpose to illustrate some of the distinctive features of the Birdsell Clover Huller, to which careful attention is invited. These features are found only in the Birdsell machine, and years of practical test, under the most trying conditions, have demonstrated their utility."

It may be secured by writing Birdsell Mfg. Co., South Bend, Ind.

TUTTLE'S ELIXIR.

820 MAPLE AVE.
Los Angeles, Cal., Apr. 24th, 1907.
TUTTLE'S ELIXIR CO.

Gentlemen: We have used Tuttle's Elixir in our stables for a long time with satisfactory results and have found it a first-class leg and body wash. We had great success in removing two bad splints from a mare, and used her all the time. It was a bad case but the cure was complete. We believe in TUTTLE'S ELIXIR.

Yours truly,
Moore Bros.

Resources of Colusa County

COLUSA county has principally been known for its crops of wheat and barley; secondly, enormous ranches. Think, if you can, of a single farm (ranch) of ten thousand acres; then add three more such farms to it, and even then you are four thousand acres shy of the total of one ranch in this locality,—namely, the Glenn ranch, which comprised 44,000 acres. The Boggs ranch, with 10,500 acres and the Packer ranch with 7000 acres are other samples. As some of these ranches gradually come upon the market for subdivision, the poor man gets his chance. The man with small capital can buy ten, twenty or forty acres and be independent for life.

Colusa county, about 70 miles north of Sacramento and about 140 north of San Francisco, is favored with a rich soil that will grow almost anything—luscious grapes, splendid oranges, lemons, figs, prunes, olives, almonds, berries, pears and apples—why, it would be tedious to enumerate them all. Colusa oranges ripen long before those in the southern part of California are ready for market. Being first in the market, they command fancy prices. At the San Francisco Midwinter Fair they took first prize against all comers.

Ask any one familiar with California what Colusa county is known for, and he will say: Cereals, Colusa sandstone and mineral water. But in a few more years the answer will be: Prunes, grapes and oranges.

In some tracts they wanted to find out how deep this splendid alluvial soil ran, so they bored as far as forty feet, and still found it. They bored twenty more feet and had to give it up, for it was still rich soil. One grape raiser near the town of Williams in this county

Harvesting Near Williams, Colusa County

just sold his grapes at \$65 for the Muscats and \$95 for the Sultanas per acre. He has only eighty acres, but pity him not, for he is putting another tract in grapes. A rancher near Colusa sold his pears from one acre for over \$400. Another nearby sold his blackberries at over \$400 per acre, and this is only his second year. And what is such land obtainable for, you will ask. Knowing that a six or seven per cent investment is considered something mighty good, it seems almost cruel to blandly inform you that just such land—land that will produce from \$50 to \$250 per acre per year—can be bought at from \$40 to \$100 an acre. And \$250 maximum is putting it very modestly, or nearly twice that sum is nearer correct in many instances.

All through Colusa county flows the beautiful Sacramento river, useful as well as ornamental, for two lines of steamers to San Francisco via Sacramento are kept busy transporting the wealth our soil produces and bringing hither from the two cities named the thousand and one manufactured products and luxuries that we have to buy from them.

Figs grow so abundantly here that people scarcely eat them. I have seen them swept off the sidewalks, just like so much worthless dirt. Oranges in your front yard and walnuts along the towns' roads in such bewildering abundance that it makes one ashamed to speak of it for fear of being accused by the cynic of bragging. We see these things, but when we put the facts on paper can hardly believe that our senses do not mislead us. We see them so much that we hardly give them a thought. And so it is with the roses and other flowers, which grow here in such profusion and in spite of people. A new-comer will pick bouquets and adorn his rooms; after he is here a while he gets so used to these glorious, blessed gifts from the lavish hand of the Creator that he too becomes calloused to his advantages. —John Hartog, Sec. Colusa Chamber of Commerce.

Plowing With a Traction Engine Near Princeton, Colusa County

Coulson's Improved Mash Egg Food

Takes Less Feed

Makes More Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

—2 to 60 Horse Power—

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropico, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,

Nurserymen and Boards of Horticulture

A Paper Read by John Isaac Before the Pacific Coast Nurserymen at Salem, Oregon. The Interests of Both Identical

It is said that eternal vigilance is the price of liberty and the truth of this is recognized instinctively, as is evidenced by the disposition of all to resist at first whatever appears like innovation, especially if such innovation in any way appears to affect us in our business or our personal rights. This disposition to resist, has been mildly termed conservatism and where it is carried too far it is known as "knocking." It is sometimes a bar to progress, but more often a check on recklessness. All good systems have had to stand the test of opposition from conservatism, until they have proven themselves of value, when they have been adopted and we, who live under improved systems and appreciate them, wonder at our forefathers for their opposition. The test of opposition is a good one, for the good will prevail in spite of it, while the bad succumbs and goes down before the test.

Coming Together.

So much by the way of introduction. I will now come to my subject and touch upon the opposition which has been felt, if not openly expressed, between the nurseryman and the tree inspector, but which has now, fortunately, reached a stage where the two are coming together and realizing that they are working for the same purpose and that, instead of being opponents, they are allies working to the same end—the introduction of healthy and clean stock. The system of tree inspection originated in my State and was forced upon us by necessity.

Welcome Guests.

In the early history of California a nursery stock was brought in from all parts without question. We possess a varied climate, where the tropical and the boreal meet. In consequence, vegetation was brought to us from the four quarters of the globe, and with it came its insect adherents. We have a glorious climate, and it was readily claimed that in it all the good things would flourish, all the bad things would perish, and that it was not possible that any injurious insect could or could exist in a climate that was good for all else. And we are still regaled with the same fairy stories. We began thus the importation of pests, all bad, some of them not very serious, but we soon found among them the San Jose scale. That was a real pest and in a short time we were doing as they are doing in the East now, destroying our trees to get rid of the bug, but it wouldn't stay got rid of. We looked around for remedies and finally struck upon the salt, sulphur and lime wash, and that helped some. We now have a native parasite that takes care of it for us, but we still have it, and always shall, and it works in perfect harmony with the climate.

It Up and Took Notice.

The next importation of consequence was the cottony-cushion scale, and when this came we sat up and began to take notice. It was an insignificant looking bug, but it was good and it increased and multiplied, even if it didn't replenish the earth, and that without number. In a short time our orange orchards were a mass of scales. They were so thick that there was no room on the trees for fruit, and many growers who started to grow oranges, when they found that they were only producing a crop of nasty bugs, cut out their orchards and burned up the trees. But this did not get rid of the scourge for the scale took to the wild vegetation, and it was evident that, to

get rid of it by fire, it would be necessary to burn up the whole country.

Origin of Fumigation.

We tried all sorts of sprays and washes, and out of the experiments made, came the present system of fumigation. But upon all artificial attempts to get rid of it, the pest seemed to thrive, and if the bug had any sense of humor, it must have laughed at our futile attempts to banish it. We finally overcame it with its natural enemy. But that is another story.

Horticultural Quarantine Introduced.

It was these experiences that gave rise to our system of horticultural quarantine. It was something like locking the stable door after the horse was stolen, but we expected to get another horse and intended to take care of it. There were two problems before us: to get rid of what pests we had, or, at least, to reduce them to a condition of innocuous desuetude, and to prevent any others from obtaining an entrance.

With these ends in view, our present system

John Isaac

was inaugurated and after many amendments and corrections, we have a fairly good system although it is still open to improvement.

State Board.

The necessity for some action looking to the protection of the orchardists, if California was to grow fruit, was thus forced upon us, and, recognizing the importance of the fruit industry to the State, the legislature passed a law organizing a State Board of Horticulture. The State was divided into districts and a member was appointed from each district. This was all right, as far as it went, but nine men working without compensation could not be expected, however, patriotic, to look after the horticultural interests of the whole State, and the next move was the organization of the County Boards of Horticulture, whose duty it is to look out for the individual counties.

A rigid system of inspection was provided for, by which all stock entering the State, or passing

from one county to another, was to be thoroughly investigated before it was allowed to pass; the work of inspecting in the counties being left to the county officers while, at the ports of entry, the State board stationed inspectors whose duty it was to look after everything arriving by sea. By arrangements with the transportation companies the horticultural inspectors of each county were notified of the arrival by nursery stock from outside points by the local agents, while the postmaster general instructed the postmasters of the State to give notice of any plants arriving from foreign countries by mail. The customs house officers also had instructions to pass no plants until they had been certified to by the State horticultural quarantine officer. So the quarantine line was as close as it could be reasonably made.

Kicks Coming Both Ways.

Of course, such restrictions bore heavily upon some, and at first it appears that they had been made in the interests of some particular class, and, in order to show how mistaken people may be, I will state that about a year since, I received a letter from a prominent California nurseryman, complaining that our inspection laws were bearing hard on him, and it was evident that they were made to injure our local nurserymen and were wholly in the interest of the tree importers. The same day I received a complaint from a prominent Eastern entomologist, voicing the feelings of the shippers of the stock from his State, complaining that our laws were evidently made to bar out Eastern stock, and to give our local men a monopoly of the trade. Of course, both were wrong. Our horticultural laws are maintained wholly for the purpose of protecting what is today the greatest industry of our State, and if it bears hard upon anyone, it is incidental and not intentional.

Three Classes.

We place nursery stock in three classes. First, that which is infested with pests or diseases which are new to our State. Any stock of this class is held up. If it is worth the trouble, the owner can have it returned at his own expense, but it can not be allowed to enter. Second, stock which is infested with pests which are already established in the State. This stock is fumigated or treated, and held until the inspector is certain that it is clean and it is then released. The reason why it is required that such stock shall be clean before it is allowed to pass is that the orchardists are required by law to spray, fumigate or take other means to keep their trees clean, and such being the case, it would be notoriously unjust to allow infested stock to be introduced and sent to them or into their section. The third class—clean stock—is, of course, passed without question.

Certificates.

Now, a few words on the matter of certificates of inspection. Many of the States provide for an inspection to be made of all nurseries at certain seasons of the year, usually in June. The inspector looks over the stock, and issues a blank certificate good for a whole year, stating the facts in the case, and it is expected that this shall be accepted by other States, and that upon it all stock shall be admitted without further question. Such certificates are not recognized in California. Our inspectors are supposed to do their own

Deciduous Fruit Culture

CHINESE TABLE GRAPES.

IN CERTAIN parts of China, grapes are raised extensively for eating fresh, preserving, drying and for the manufacture of unfermented wine.

The Province of Shan-si, 200 miles west of Peking, in the interior, has long been famous for the excellence of the product of its vines, a fact that is noted in the travels of Marco Polo. The attention of the station was called to these grapes by Mr. E. R. Lyman and through his aid we have received a very interesting account of the principal varieties there and of the Chinese methods of preserving them.

This information was kindly furnished by Mr. J. L. Stoward who is thoroughly familiar with the facts and who has taken great pains in sending descriptions.

The following account is extracted from Mr. Stoward's interesting letter:

Grape No. 1.—Black, large, compact bunches of sharp-pointed, elongated berries of brisk, racy flavor and very sweet to eat fresh. The fruit ripens in August. The appearance of this grape, judging by the excellent drawing sent, is very striking and resembles some of the Persian varieties, which have been introduced into California.

Grape No. 2.—Black, large bunches of loosely hanging, slightly ellipsoidal berries. As sour as a lemon when fresh but becoming sweet without the addition of sugar when cooked. Used for making grape-juice. This variety is called "Ling dan"—Separate Ball, on account of the long pedicels, which make every berry hang separately.

Grape No. 3.—Red, compact bunches often weighing 9 and ten lbs., of large, round berries often more than one inch in diameter. This variety ripens by the first of September and is kept in perfect condition until long after the Fourth of July of the following year. It constitutes the main part of the grape crop of Shan-si.

Grape No. 4.—Red, loose bunches of grapes of almost the size and shape of a finger. Said to resemble Flame Tokay in texture but to be of better flavor and thinner skin. This variety is much liked by the wealthy Chinese who buy up the crop at from 50 to 100 cash per catty when other varieties are bringing only 14 and 15 cash for the same amount. Raisins are made from this grape and smoked after drying.

The grapes, especially Nos. 3 and 4, would be interesting additions to the already long lists of varieties introduced into California. Mr. Stoward has kindly promised to supply the Station with cuttings which will enable us to determine of what value these striking varieties are for our conditions.

The fact that grape No. 3 which, judging by the description, somewhat resembles Flame Tokay in appearance, is kept nearly twelve months fresh, in good condition, is very interesting. Mr. Stoward went to considerable trouble to find out just the method used to accomplish this result.

The grapes are kept in above-ground cellars with walls 3 feet thick, built of boulders. The temperature is kept cool and even and the air as dry as is possible without causing shrivelling by evaporation. The cellar has only one opening—the door—which is closed by a mat of millet straw one foot thick. The grapes are

laid in thin layers on wilted lotu leaves placed on stone shelves and are covered with the same kind of leaves. The grapes intended for early sales are wrapped in the same leaves and packed in willow baskets which are piled in the center of the cellar.

The principle of these storage cellars is identical with that of the houses used in Europe. The essential points are a cool even temperature between 40 and 50 degrees Fahr. and moisture enough in the air to prevent undue evaporation of the juice through the skins, but not enough to keep the surfaces damp. Shrivelling and mold, the two principal enemies of stored fruit, are thus prevented.

How much of the keeping quality exhibited by these grapes depends on the careful handling and how much on the essential resistance of the fruit remains to be tested.

The cuttings when they arrive will be grafted on old vines in order to obtain enough for distribution in various sections for trial.—Frederic T. Bioletti, Berkeley.

PECAN CULTURE.

It is astonishing how few people there are who know what a pecan nut is, and still more surprising to realize that there are very few people who recognize differences in quality or varieties and who really know that there is as much difference in the flavor of pecans as there is in the flavor of different varieties of apples. The wild seedlings may be thick shelled, bitter and astringent, whereas the cultivated forms are thin-shelled, rich and delicate in texture and flavor. For many years the markets of the East have received and consumed considerable quantities of the seedling nuts of Florida, Louisiana, Mississippi, Texas and other regions where the pecan is indigenous. These nuts range from good to very indifferent and poor. They are present the same polished brown exterior in the grocer's window, but vary greatly in the quality of their contents.

The United States is a good deal of a nut-eating country. Something over five million dollars' worth of nuts are imported annually. On the other hand, we only export about \$30,000 worth. This export quantity is largely made up of English walnuts grown on the Pacific Coast and perhaps a few pecans from the South. It is interesting to note that as the pecan has become known in the East its consumption has increased, and with increasing consumption have come also higher prices. Less than 20 years ago ordinary nuts could be bought for five or six cents a pound. These nuts, which were then used by nurserymen for growing seedling stocks, now bring from eight to twelve cents a pound. There is still greater advance in the price of the really edible varieties. When formerly they were sold for ten cents, they now bring twenty and thirty cents, while the propagated varieties sell up to fifty and sixty cents, when a private and personal trade is established. There is no question at all that the pecan is one of the coming nuts, and is bound to be a leader among the orchard fruits of the future.

As a fruit it possesses the important quality of being nonperishable within reasonable limits. Cold storage is not a factor and transportation facilities are of relatively small importance.

This tree, which belongs to the wal-nut family and is known technically as the name of *Carya, olivaeformis*, more lately, *Nicoria pecan*, has a wide distribution in the United States. Naturally, it is distributed more abundantly on the rich alluvial bottoms of the streams than the higher lands. The pecan runs far north as Southern Iowa and as far west as the Colorado river, in Texas, extending southerly to Central Georgia. Roughly speaking, we may say that it occupies practically the same area as the cotton plant, although it can be grown farther north. John Craig, Cornell University.

CROWN GALL.

Most of our fruit growers are familiar with the orchard disease which is known as crown gall. This occurs on nearly all of our orchard trees and is most commonly found as a bumpy and warty growth around the crown of the tree just below the surface of the ground. But these growths may occur at any point on the roots and sometimes upon the trunks above ground.

Every experienced orchard man knows of the destructive nature of this disease. If a tree is badly infected when planted, it is usually the case that it does not come into full bearing, but simply makes a slow, stunted growth and usually does not live more than seven years from the time of planting.

There is no practical remedy for such diseased trees and, moreover, it is the worst kind of folly to allow them to be planted, as numerous observations by many people go to show that one diseased tree in an orchard serves as a source of infection for many healthy trees. This being the case, proper inspection of nursery stock cannot be too strongly insisted upon. It is difficult enough, as it is, to get trees to live where they have been shipped long distances and then exposed to our drying air and intense sunshine upon being planted. But if we find, in a year or two, that a portion of the trees are infected with this disease, the loss is all the harder to bear. But, strange to say, each spring the inspectors have more or less trouble with a few people who do not wish to have their stock inspected.

This disease has never been considered injurious to apple trees in the Eastern States; and recently one of the workers of the Department of Agriculture has issued a bulletin describing the results of very careful experiments which were conducted near the vicinity of St. Louis. These results go to show that under the conditions which exist there, the disease does practically no harm. All Eastern men are, of course, familiar with these experiments and, consequently, think that our inspection is not only foolish, but very unjust to them.

The workers at the Colorado Agricultural College have been severely censured by some of these firms for the moral support they have given some of the county inspectors. Nevertheless, we must look out for our own interests, and growers should not only insist upon a thorough inspection, but should try, as far as possible, to buy their trees of nurseries which, at least, try to eradicate this disease.—W. Paddock, Colorado Agricultural College.

VERY WELL PLEASED.

J. W. Dixon of Corralitos writes: Enclosed please find \$1.00 for renewal of my subscription to the "Cultivator." I am very well pleased with your paper.

Implements for the Ranch

We can supply **everything** that is needed in Ranch Implements. If you need a wagon we have the Shuttler—the "king" of all wagons. We also have the Burg, the Harrison, and the Winona Wagons—all good.

If you want a Fertilizer Drill, we can supply you with the BUCKEYE, built especially to meet California conditions—and it does it. No better drill is made—we have never seen one as good.

We have the Great Western Endless Apron Manure Spreaders. Every ranch should have one—saves time—saves money—increases crops.

We are the largest implement and vehicle house in Southern California and we maintain our supremacy by square dealing, reasonable prices, and absolutely reliable goods.

We want to see you at our store.

Get an Easily-Operated Engine For

IRRIGATION PUMPING

WHEN you buy an engine for irrigation pumping you don't want to get one that will require an engineer to run. What you want is an engine that will practically run itself for hours at a time. One that is sure and safe and steady, one that is simple in construction, and easily understood and operated.

I. H. C. Gasoline Engines

are that kind, and for that reason are especially adapted to pumping for irrigation. A small boy can look after an I. H. C. Engine, and run it as successfully and economically as anyone. Look it over once or twice is all that's necessary in a day's run.

Now, what else do you want in an engine for irrigation pumping?

Economy—To be sure, you want an engine that will pump the largest

amount of water at a small cost. And here again I. H. C. gasoline engines fill the bill. Ordinary stove gasoline is the fuel, and the cost per hour will be about 1½¢ per horse power—about 45¢ a day for a three-horse power engine working 10 hours. That's cheap enough isn't it? And convenient. You can buy gasoline by the barrel, and always have plenty of fuel on hand.

Durability—Because I. H. C. engines are simple and strong in construction, they are durable, too. There's nothing much about them that can wear out. Repairs are small and inexpensive; parts can always be readily obtained, and you can replace them yourself.

Ease of Operation, Economy, Du-

MILK CANS ROB YOU

Look through a microscope at milk set to cream in pans or cans and you'll see how they rob you. You'll see the caseine—the cheese part—forming a spider web all through the milk. You'll see this web growing thicker and thicker until it forms solid curd. How can you expect all the cream to rise through that? It can't. This

caseine web catches a third to half the cream. You stand that loss just as long as you use pans or cans for they haven't enough skimming force to take out all the cream. But, just the minute you commence using a Sharples Dairy Tubular Cream Separator, you stop that loss.

Sharples Dairy Tubular Cream Separators have 10,000 times more skimming force than pans or cans, and twice as much as any other separator. They get all the cream—get it quick—get it free from dirt and in the best condition for making Gilt Edge Butter. Caseine don't bother the Tubular. The Tubular is positively certain to greatly increase your dairy profits, so write at once for catalog I-260 and our valuable free book, "Business Dairying."

MORE SILOS.

AS MEN are always seeking to do better and better work, we therefore find them building silos of more durable materials than wood. The plastered and lath silo, the brick lined, the concrete and the brick and stone silo cover the varieties in use. The stave silo is an expedient of the farmer that moved so often that whenever a covered wagon came along the road, the chickens ran to it, dropped down on their backs, held up their legs and waited to have them tied to be carried to the next stopping place.

Wooden Silo Brick Lined.

This is, undoubtedly, one of the best of the wooden forms, wherever bricks can be purchased at a reasonable price. The foundation is the same as in the wooden silo. Sills are set and secured the same, except that the sills are placed enough forward to allow the brick lining to rest directly on the stone or brick foundations. The studding is nailed to the sills then on both sides of them are nailed the three-inch stuff; this is fence boards six inches and sixteen feet long sawed through the lengths. These boards go round and round and as the hoops and on them depends the strength of the silo. Be careful that they are nailed twice to each studding.

Lining.

The bricks are laid flat usually, as this makes them stronger, sometimes however, they are laid on their edges. It is well to drive an iron spike into the studding and embedding it into the mortar on every fourth row of brick. The mortar between the bricks should not be over half an inch thick and plenty should be used back of the bricks against the lining to fill up the spaces solid. It is possible to make the inner face of the brick smooth enough not to need cementing, but it is hardly likely that ordinary California brick will be smooth enough to make a good inner wall without washing them down with cement. In estimating the cost: if bricks are \$7.00 a thousand then \$252 will buy the brick to put in flat or if they are on edge the cost will be \$194, in a silo of twenty feet in diameter and thirty feet deep.

Lathed and Plastered Silo.

This silo is cheaper and usually goes by the name of the inventor, Mr. Gurler, a dairyman of note in Illinois. The first silo of this type built by Mr. Gurler is now ten years old and since then he has added half a dozen more to the original one. The foundations are made on the same plan as the other silos. The two by four studding are set up every foot, three-eighths sheeting is carried around the inside and nailed firmly to the studding. The outside hoops are six-inch fence boards nailed firmly to place on the outside of the studding every three feet for the first half of the silo and then every four feet; a second six-inch board is nailed over the first one to make it a heavier hoop and to break the joints.

Plaster Lining.

The three-eighths sheeting is rip sawed into five strips with a beveled edge. These are the Gurler laths and are, on the narrow side not quite

three-fourths of an inch, while the wider edge is a little less than one and a half inches. These laths are fourteen or sixteen feet long and are bent around the inside of the silo with the narrow surface to the wall. They are firmly nailed to the studding through the sheeting leaving an inch and three quarters space between the outer edge. The walls are cemented with a mixture of two parts of cement to four of sand. This is for an indoor structure, where the silo is outdoors, by running the outside hoops of fencing boards around in diagonally form, three each direction and firmly nailing them where they cross the silo is strong enough to stand high winds.

Brick Silo.

The foundations are of brick or stone; a five-eighths-inch round of iron

is usually embedded close to the ground to add strength. These rods are divided into four lengths and have the ends turned outwardly for the last few inches. These ends are allowed to come between the outside bricks and firmly bind the mass together. The walls are laid up carefully with water-soaked brick; the first half of the silo the wall should be at least three wide, while four is better, half way up the wall one brick is taken off on the outside making the upper walls lighter. Every third row the

Easy to Wash

Quick, too. The picture shows you why.

(It's an exact copy of a photograph.) You can't expect pure cream and good butter from a dirty separator bowl, and the construction of some bowls makes it next to impossible to clean them. Others have from 30 to 40 inside pieces of all sorts and shapes, and to get them all actually clean exhausts both time and patience and makes more work than the pans and crocks. Then some bowls are long and narrow not unlike a shot-gun barrel, but you can't clean them with a ramrod because one end is closed, so you swab them out with a rag on the end of a stick, and if you're not mighty careful the milk and water squirt out all over you. Now, please look again at the picture. While the improved

UNITED STATES SEPARATOR

Holds the World's Record for Cleanest Skimming,

yet simplicity has not been sacrificed to clean skimming as in other makes. The picture proves it. Only four parts to the whole bowl—two simple inside cups, the smooth steel bowl and the cover. Notice that the bowl and cups are wide enough to be easily cleaned inside, and in the cover there are no crooked tubes or obstructions of any kind to catch and hold dirt.

A brush is the best and most sanitary means of cleaning dairy utensils, and so with every U. S. Separator we furnish a strong, stiff-bristled brush that cleans all dirt and "skum" out of the bowl. It's no job at all to clean a U. S. bowl—three to five minutes' work does it easily and thoroughly.

Our new 1907 catalogue shows five different photographs of the U. S. bowl, both taken apart, and put together ready for work. It also tells everything else about the U. S. Separator. You should certainly see a copy of this book before you put any money into a cream separator. We'll gladly send you a copy free. Just write—TODAY—Send catalogue number G 20, addressing the

Cream Coolers

You should cool your cream as it comes from the separator.

Our Cone Cooler will cool to within two degrees temperature of water. Eliminates all bad odors and improves quality of cream and butter.

Send \$1.75 for sample.

	Cream Coolers	Milk Coolers
1 Cooler	\$1.75 each	\$2.50 each
12 Coolers	1.50 "	2.25 "
50 "	1.40 "	2.10 "
100 "	1.35 "	2.00 "

These Coolers are durable, practical and easy to clean and reasonable price. You cannot afford to be without one.

We carry a large stock of "Star" Copper Coolers at prices from \$15.00 up.

Write us for prices on Pasteurizers (we have them in stock), Ripeners, Cream Separators, Engines and Boilers, Milking Machines. We supply anything used in a Dairy, Creamery or Cheese Factory.

Our goods are "up to date."

O. J. WEBER Co.

Cow Milking Machines

Our Milkers operated by Foot Power are very simple, durable, easy to operate and will milk from 20 to 26 cows per hour. If you are milking cows, write us for circulars and prices, or call and we will arrange to show you our machines in **actual operation**. Our milking machines have been in daily use for **ten months** in Southern California—and are **still in use**.

Phones: Sunset, Broadway 5006; Home 2627

all is bound by turning the bricks and in. Double iron ties should be placed at the top and bottom of the first three doors. After the walls are up the inside can be protected with a heavy coat of cement, well white-washed to keep the acids of the silage from acting directly on the cement. Some people dip the ends and sides of the bricks that are to be exposed to the silage into thick, hot coal tar before placing in the wall. The doors of the brick silo will be described when the stone silo is taken up, for they are nearly the same in form. This coal tarring seems like extra work, but then a farmer is not usually lazy. He is not like the man named John Hole that wrote his name as J. when punched a hole in the paper to save labor.

Stone Silo.

The stone silo is often built from the stone of the farm, often a rocky ledge can be taken out of a field to build the silo and clear the field at the same time. The Italians and Irish are the best masons we have in California. They alone will carefully fit in the stones, as they seem to have the trained eye that sees when a stone will fit without trying each one to the place. I cannot imagine anything more exasperating than to see a man pick up stone after stone and lay them up, take them down and up and down, before he fits them. The wall underground should not be less than two feet thick and laid in cement. The larger stones must have the spaces between them carefully filled in with smaller stones as the walls ascends it is narrowed to eigh-

teen inches, twelve or fifteen feet above the surface. Good lime mortar may be used in the upper portion instead of cement.

Inside.

The cement for the inside is made heavy, using one part of cement to one or one and half parts of sand. This cement must be well packed on with a trowel, not merely smoothed and air bubbles left in it. It needs to be as firm as a floor. A heavy coating of white wash comes next to keep out the acids of the silage. The doors are arranged in the walls with an iron rod above each one. This is of five-eighths-inch rounds and usually twelve feet long. The ends turned off at right angles and like the rod itself firmly set into the wall. The door frames are made of lumber four by four bolted together with a space between them. One frame being flush with the inside; the other on the outside edge. The spaces between them is filled firmly with mortar after they have been placed with iron bolts run into the mortar between the stones to bind them in place.

Doors.

The stops for the doors are fitted in and around the doors swung into place. Doors are made from six-inch tongued and grooved stuff put on at right angles, screwed to the cross boards. Thick roofing paper is tacked to the edges to make the doors fit tightly. Then plastering of adobe mud is added as a further sealing. The addition of a pound of cheap glycerine to the water used in making the mud will prevent the adobe from flaking off when dry. Flat rocks are best for the walls. Where boulders are the only rock

available, it is best to build a concrete silo and use the boulders to furnish rubble for the walls. I ask your pardon for the undue length of this paper. Next week we will finish with the silos by describing the concrete one.

CALIFORNIA LIVE STOCK BREEDERS' MEETING.

The Cultivator has the following from Secretary Major of the California Live Stock Breeders' Association:

"The California Live Stock Breeders' Association will hold its fourth annual meeting in Sacramento, Wednesday evening, September 11th, at eight o'clock. Thursday afternoon, September 12th, at five o'clock, will occur the annual business meeting of the association when the following amendments to the By Laws, which have been proposed, will be considered:

Meetings: The annual meeting of this association shall be held at such time and place as shall be decided upon by the Board of Directors. Dues: The annual dues of this association shall be one dollar.

The committee is sparing no effort in preparing a splendid program and there is every indication that this meeting will be the best that has yet been held. We hope you will be there for every one interested in live stock should be present.

There are two extremes in caring for the cow, negligence and over-pampering. Avoid both.

If the butter is too soft, it has probably been churned at too high a temperature.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

WHY NOT CALIFORNIA TOO.

The Committee on Special prizes at fairs of the Holstein-Friesian Association of America, announces that, to date, arrangements as follows have been made:

National Dairy Show, Chicago, Ill., Oct. 10 to 19, \$463 in special prizes. Classification to be soon announced.

Spokane, Washington Inter State Fair, Silver cup, for best exhibit of this breed.

Also a large number of other State Fairs, but none for California. California is worth it for it has some of the finest Holsteins ever.

The origin of the Jersey is a subject of interest, but there is a very great divergence of views on the subject. There appears, however, to be very little room for doubt that the breed is graded up from a cross of Brittany and Normandy cattle. It is true that there are many points of great dissimilarity, but it is well recognized that the characteristics of any cross or breed can be "bred out" by careful and scientific selection. Such selection is and has been for generations past systematically practiced on the island.

No dairyman ever went hungry, or failed of having cream in his morning's coffee. Farms have been paid for, and good farm houses erected, children educated and married off, and the sons-in-law started in business. The gospel has been preached, the parson paid, and time taken to do one's duty as a citizen.

The tester and the milk scale mark the parting of the cow paths. They show which leads to prosperity and which to the poor house.

The Ornamental Garden

THE PETUNIA.

PETUNIA is a genus of dwarf perennial plants found native in South America. The present garden forms are assumed to be hybrids forms *P. nyctaginiflora*, introduced into European gardens in 1823, and *P. violacea*, introduced in 1831. Originally, the petunia produced single flowers only, and it is due to the skill and care of the hybridist that the present popular double forms were evolved. The habit of growth was also improved by careful crossing and selection and the hybrid varieties were soon cultivated to the exclusion of the original species, their flowers being more varied in form and color, and of larger size and greater importance.

Some years back the petunia was a popular plant in Victorian gardens, and very fine varieties were raised, named and distributed by some of the nurserymen of that time. Fine specimen plants grown in pots were often seen at the horticultural shows, and the plants were largely used also for bedding. Their popularity has decreased largely, but lately they are again coming into favor, the introduction of new, large, brightly-colored strains being mainly responsible. The petunia is one of our best, hardiest and most easily grown border plants. The plants endure heat and drought well and continue to produce their attractive blossoms for a long period during the summer. The single-flowered varieties are most suitable for border decoration, or for massing in schemes of color. They are not suitable for cultivating in places specially liable to dust, or where the atmosphere is heavily charged with grime or smoke, their viscid leaves becoming coated with such substances, which are difficult to eradicate and which check the vigor and bloom of the plants.

Propagation—Culture.

Petunias are usually treated as annuals, except in the case of specially fine varieties. The plants are raised from seed annually and when their blooming season is over are thrown away and a new stock raised from seed for the ensuing season. Most of the double kinds are propagated from cuttings, though there are strains of seed that will produce about 25 per cent of double varieties. The seeds may be sown in autumn or spring. Autumn sowing is preferable, except where severe frosts occur in spring. The plants are strong and will bloom early and continuously if well cultivated. The seed is very small and should be sown in light soil in well drained pots or boxes. The soil should be rather moist and the surface firmly pressed and even before sowing the seeds. A very light covering of soil should be applied and the whole watered very gently and lightly to prevent the seed being washed together in heaps, after which the pots or boxes should be transferred to a close frame, or a sheet of glass should be placed closely over them till the seeds germinate. This covering should be removed gradually as the plants grow, being finally removed when they are 1-4 inch in height. The plants should then be potted into single pots, or transplanted into other boxes of light soil and grown on till spring, when they should be planted out. When the seeds are raised in spring they may be allowed to remain in the seed box until ready to plant out

where it is intended they should bloom.

Cuttings of the young shoots that develop laterally along the stems, or at the base of the plants, root readily in a cold frame, or under a bell-glass or a closely covered box, if inserted in sandy soil during April. The cuttings should be about three inches in length, the leaves trimmed from the lower half of the cutting and the cuttings inserted around the edge of the pots of sand. The pots should be well drained and the sand washed, to remove any fermenting medium. A box (like a butter box) should be filled to within six inches of the top with light soil, sand or ashes. Holes should be bored in the bottom to permit of drainage. The cuttings may be inserted, say, six in a 5-inch pot, always inserting cuttings around the edge, in preference to the center of the pots. Four such pots will be accommodated in a butter box, and after the cuttings are inserted should be plunged to the rims in the material in the box, lightly watered and covered closely with a nicely fitting sheet of glass. In such a frame a number of cuttings may be rooted during the season. After the cuttings are rooted they should be potted into small pots and grown on till spring, when they may be either planted out in the border or re-potted and grown on in larger pots. Petunias succeed well in pots and nice bushy plants may be developed by occasionally pinching the leading shoots. The soil for pot culture should be light and porous and the pots should be thoroughly drained. Soil.

The most suitable soil for growing petunias in the open border is a moderately rich light loam, but the plants will thrive fairly in any fair garden soil. Excessive manuring will produce large plants without a corresponding increase in the number or quality of the flowers. A fairly open position should be allotted them, and ordinary border cultivation, including watering during dry, hot weather, will suffice to bring the plants into a condition that will enable them to produce an abundant crop of flowers.

Many of the ornamental shrubs may be successfully pruned this month. The instruments used in pruning should be first soaked for a short time in a solution of carbolic acid. Diseased germs may be easily carried from one shrub to another during the hot weather on the pruning knife. It has been discovered that plants or shrubs pruned now will lose less sap than those pruned either in the spring or fall. After the wound has dried a few moments it should be painted with white lead, if it is a large one.

This is a good time to set out azaleas in the garden flower bed. Bury the pot up to the rim, allowing a little of the mellow dirt to fall over the top of the dirt in the pot. The place selected should be partially shaded and the ground should be kept amply moist by frequent watering.

As the leaves of the lily of the valley, tulips and crocuses turn yellow, they should be cut off below the dead portions. Their presence is of no value whatever to the plant and they may be the means of harboring a great many of the fungi which assault these plants.

The Vegetable Garden

THIS MONTH.

PREPARATION for winter crops is the feature of this month in the vegetable garden. Pruning of berry es, mulching of soil, thorough irrigation and hoeing are, of course, essential with the crops planted last month and earlier. Corn may yet be planted for late roasting ears. In planting be sure to mulch. Quantities of seed are lost every summer neglecting to mulch the ground. After seeding, these small saplings are very tender when just sprouting and grow up quickly when they strike the ground, burning crust that is over them. This is a matter of great importance, and with a little extra care one is able to have nice crisp lettuce, etc., in the fall of summer, at a time when the crop is greatly appreciated. Plant last crop of potatoes and green beans. Sow cabbage, cauliflower and celery for main crop. Sow tomatoes for winter crop in the foothills or other sheltered places. Cucumbers and eggplant are also sown now for winter crop.

SAVING SEED.

In general it may be said it does not pay to save garden seed, and this is especially true of all sorts which are light in weight and small in bulk, but there are others, notably peas, beans and corn, and any of these can be improved from year to year if care is taken in selecting the seed. It is a good plan always to have the saving of seed in mind at the beginning of the season, and plant a few rows or hills, as the case may be, depending upon the amount of seed wanted, in some place where they will not mix with other varieties. Give these extra care and destroy all plants that are not vigorous. If earliness is the object, select the pods or ears that are ripest, giving preference always to the largest. If there are not enough of these "first fruits" of the patch to make up the quantity of seed wanted for the general crop, gather the later maturing and keep that seed separate for the main planting next year. Plant the seed first selected in a separate patch and again pursue the same method of selection, and with each succeeding year the peas, beans and corn will grow earlier and better. Of course, this method can be pursued with other plants with great success, being the method experts use in improving and perfecting the different varieties of fruits and vegetables, though they go farther in attempted improvement, often resorting to cross fertilization of blooms, etc., in order to produce new or better types.

The farmer-gardener does not need to take this trouble for the simple method indicated above will give very good results. Of course, it is too late now to take advantage this year of the suggestions offered in regard to planting a patch intended primarily for seed, but it is not too late to save the seed from the largest and most perfect specimens and thus take one step in the matter of plant improvement.

There is another advantage in saving seed from the home garden or truck patch besides financial considerations, and that is, it is a most interesting diversion. It affords opportunities for study and observation which will lead to independent investigation and experiment, to refute or confirm the theories of others, and in his way the investigator, with his mind at work on pleasing and interesting problems forgets himself, and his toil is lightened, so that what the

unthinking regard as drudgery is to him but a source of wider and deeper knowledge.—[Coleman's Rural.

YAMS.

A reader of the Journal of Agriculture wants to know the difference between yams and sweet potatoes, and how yams should be prepared for the table, and that paper answers as follows:

Langworthy says that the true yams, which are often confused with sweet potatoes, belong to a group of climbing plants. The number of varieties, however, found in the tropics and subtropics is very large and many of them bear starch yielding roots which are edible and which vary greatly in size. Some are no larger than potatoes, while others are several feet in length and weigh as high as thirty pounds. The true yams are grown extensively in Southern China, Oceania, Porto Rico and the West Indies, where they are a very important source of carbohydrates in the diet. They rank next to sweet potatoes in those food elements. When used as a vegetable they may be prepared similar to sweet potatoes, by being boiled, baked or roasted, cooked in broth or stewed. The flesh of the more common varieties have a yellow flesh greatly resembling the sweet potato. In flavor they are very like sweet potatoes, so that when they are cooked it is sometimes impossible to distinguish them from the sweet potato. In digestible carbohydrates they rank very close to sweet potatoes. About ninety-eight per cent. in the latter are assimilated as against ninety-six per cent. in the former.

One of the worst pests bothering our Colorado potato growers is the scab which is a very persistent fungus disease. It gets into the soil and on scabless potatoes by associating with scabby ones. It is not known how long the spores of this fungus will remain in the soil and maintain vitality, but the indications are that it is not less than seven years. The disease manifests itself first by tiny black spots upon the potato which later develop into scabs. Ridging the potato hills, which prevents the water from coming in too close contact with the tubers during irrigation, is most effective in preventing scab. Soil that is too moist favors the growth of the germs and in fact propagates the scab disease. Rotation of crops is another means of preventing scab, but the germ is quite frequently found in new ground which has never been planted to potatoes, and therefore rotation cannot always be depended upon.—Denver Field and Farm.

For fifty years the railroad companies have been working on plans for killing weeds along their rights of way by the employment of mechanical means and now the Union Pacific people believe they have the problem by the tail with a down-hill pull. They have a new gasoline weed burner which covers twenty-five miles in twelve hours, while heretofore it has required a gang of sixteen men working a full day to cut the weeds from a single mile of track. The weed burner is built entirely of steel with regulation trucks. At one end is a gasoline engine, used for propelling the car and pumping the air which forces gasoline to the burners spreading out near the ground. Tanks carried on the car platform contain enough gasoline for

a day's run. Through rows of burners spreading well beyond the rails, the flaming gasoline is forced downward into the weeds.—Field and Farm.

INCREASE ITS USEFULNESS.

Every paper wishes to increase its usefulness and appreciates it as a compliment when its patrons have the same desire even if it now has much that gives satisfaction. In remitting for his paper, Henry H. Hassard, Jr., of Oakland says:

Your paper is satisfactory to me and hope you will be able to increase its usefulness.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

THE NURSERYMAN AND COMMISSIONER.

Continued from First Page

work, and take no one's word for it. We inspect all stuff coming in, and if any pests find entrance it is our fault. We are not supposed to inspect any stock going out, although in order to comply with the laws of other States, some of our inspectors do issue certificates of cleanliness, but this is on their own responsibility and it is not required by our laws. We do not care about the stock we send out of the State; it is nothing to us how badly it is infested; it does not threaten or injure our orchards to have such stuffs sent away, and so we are ready to leave the other fellow to look after his own interests, but in the case of stock coming in, it is an entirely different matter.

Nor do we think it is safe to depend upon an annual inspection, or to accept stock inspected on the wholesale plan. It seems to us too much like Benjamin Franklin's method of asking a blessing. Ben, as you may imagine, was a very busy man, and had little time to spare for forms, so, in order to do his whole duty, and save time, he used to ask a blessing on his food supply en masse—he would bless the flour and the pork in the barrel and let it go at that. So, in the matter of inspecting a whole nursery once a year, it savors too much of the Ben Franklin plan. It matters not, either, how conscientiously the work may be done, there are always chances and strong ones, too, that pests will escape notice, or, that eggs, or young larvae may be overlooked and that these will develop before the stock reaches its destination. It will be recognized, therefore, how utterly useless such inspection is as a matter of protection.

Then, there is always a chance for careless work. We do not know who is doing the inspecting at the other end, but we do know who is at this, and we are much more willing to rely upon the man we know, and whose work we can superintend than one hundreds of miles away and who is not in any way responsible to us, and against whom the grower has no redress, if the work is not properly done. As it is now, if our inspectors do their work carelessly, or are neglectful of our interests, we can get rid of them, or at least, have the pleasure of expressing our opinion of them emphatically when we meet them.

It is for these reasons that we insist upon it that our horticultural inspector shall look after all stock coming in and not bother his head about that going out—let the other fellow attend to that.

Unjust to Some.

I do not suppose that a law was ever passed that did not bear hardly upon some one, in fact, that is what laws are for. They are for the purpose of regulating our commerce one with the other, and if such commerce did not need regulating then there would be no need for laws. But it is often the case that, in the application or enforcement of laws, unnecessary hardships are entailed, either through misunderstanding, or overzeal on the part of those having charge of their administration. I presume that it has been so in some cases with regard to our horticultural

laws, or, at least, it may have appeared so, for I do not know of any cases where the inspectors have gone beyond the plain letter of the law in the discharge of their duties, although we have received many complaints to that effect.

No Real Conflict.

Nor is there any conflict between the nurseryman and the inspector. The inspectors are working in the interests of their constituents. They represent the greatest industry of our State. In it there are millions of dollars invested, tens of thousands of people are employed and depend largely upon it for their livelihood. It supports thousands of homes and bears a very large portion of the burdens for the maintenance of the State. It is too important a matter to neglect, and the introduction of one pest might cause losses amounting to hundreds of thousands of dollars, if, indeed, it did not ruin it. It is to guard against such possible dangers that our laws have been formed and are now enforced. And there is not one nurseryman in the whole United States who would willingly, knowingly, ask us to let down the bars in order that he might ship us infested stock. Knowing the character of the men engaged in this business as I do, I make this assertion. Then, where is the cause of conflict between them, or why should there be any dissatisfaction? If the nurserymen will see to it that their stock is clean, and the inspectors do their duty, they will be working in harmony and to the same end and will find, as I stated at the commencement, that they are allies and friends, not opponents.

Of course, we sometimes hear rumors of attempts to evade our laws, but in all such cases, where we have traced them out, we have never found them true. California has an embargo on certain sections of the East where Peach-yellows and Peach-Rosette exist, and trees from such points are not allowed entrance. These are among the worst of the peach diseases and have never been introduced into our State. Several reports have been made to us that stock being shipped to California has been procured in the prohibited districts and re-shipped from clear sections, with the statement that it had been grown there. I am pleased to state that in all such reports we have never found a vestige of truth.

Just as Good as We Know How.

Touching again upon our horticultural laws, I will say that, being human and being enforced by men, they are not yet perfect, but they are as good as we know how to make them. Perhaps the greatest weakness is in their enforcement. We have our horticultural boards in all the principal fruit counties and upon these devolves the duty of enforcing the laws. In one county the commissioners will do their full duty, as they understand it, and do it conscientiously; in another and, perhaps an adjoining county, the board may be more lax in their enforcement of the law, or take a more liberal view of its provisions. In such a case, it appears to the shipper that he is being discriminated against in the one county, and he complains about it.

If we could establish some method

uniformity in the enforcement of horticultural inspection laws, though they were enforced in strictest manner allowable, there could be less reason for complaint. We have many complaints from this state, and especially from Eastern nurserymen, who have had their oranges passed without trouble in one state, while it had been held up in another. We fully appreciate the importance of this, and the necessity for a uniform system of inspection. Perhaps we may have it some day, but at the present time, we have got to work as best we can under our present system and hope for the future when all inspectors shall act intelligently in the enforcement of the law in which case there will be no reason for complaint, so long as they are within the letter of it, no matter how strict they may be, and if it could be, the nurseryman would realize that our laws are for our protection, not for his injury, and he would work with us.

UNIVERSITY EXTENSION WORK IN AGRICULTURE.

The annual report of the Farmers' Institute work under the department of University Extension in Agriculture at the University of California has been compiled. Prof. Warren T. Burke, Superintendent of the extension work, today had many interesting comments to make on this report. It covers the work of the year ending June 30, 1907, and gives interesting and instructive items of which the following may be noted:

During the past year Farmers' Institutes were held in thirty counties of the State. The total number of institutes held during the year was thirty-four. Thirty-three of these were one day meetings; forty-eight continued through two days while five were of three days' duration. The total number of sessions was 296 while the total attendance at these meetings was 20,470, making an average attendance of 69 at each session. It required the services of twenty-five State lecturers and one hundred and ninety-five local speakers to carry out the work of these Institutes. Of these State lecturers thirteen were employed at various times to give instruction in special topics while ten lecturers and demonstrators from the faculty of the College of Agriculture devoted a total of one hundred days to the work.

In addition to these already noted, three general Institutes were held. Two of these were in conjunction with the States Teachers' Institute at Fresno and Chico and one with the Sonoma County Grange. The total number of sessions at these meetings was eight and the total attendance 2500 and an average attendance per session of 212.

A great many citizens of this country do not realize the nation's greatness. While we have but about 6 per cent. of the world's population, we produce each year about 22 per cent. of the world's wheat, 30 per cent. of its gold, 32 per cent. of its coal, 33 per cent. of its silver, 34 per cent. of its manufactured articles, 35 per cent. of its iron, 36 per cent. of its cattle, 37 per cent. of its petroleum, 54 per cent. of its copper, 75 per cent. of its cotton and 84 per cent. of its corn. When we remember that it is within our power to double the output of nearly every one of the above products we can begin to see how really great we are.

With the Citrus Growers

THE EVIL OF SHIPPING GREEN ORANGES.

CALIFORNIA once endeavored to stem the tide of green oranges which are shipped at the beginning of each season, but with little avail. Either our people are caloused or it has been found that the market has not been injured as much as anticipated by some. It is still a matter of regret with many. It is, however, a sensitive question for in each section "our oranges you know ripen and sweeten up so much earlier than in other sections," is such a well established "fact" that it cannot be talked against. Besides, many look at it as we do at the first early spring apples—eat them with a wry face and long for the later, full ripened, luscious fruit.

A writer in the Florida Agriculturist is, however, appealing for less of this evil and writes as follows in that paper:

I don't know of anything that hurts the reputation of Florida oranges more than shipping them green. Did it ever occur to you, brother orange grower, that the very oranges you sell to some packer to go North are not fit to eat;—that these very green oranges go into a hot house and are made to look yellow, and are then offered upon every fruit stand in the city, with a big sign, "Florida oranges;" then when a man takes a dozen home for his family to eat or one is being served in a hotel or restaurant, what do you think he says when he puts it in his mouth? I really don't think it would look good in print to repeat it.

Now let us see what the results are. The consumer shuns Florida oranges like a "burnt child;" hotels and restaurants stop serving them, and the result is Florida oranges are not wanted in the market until after Thanksgiving or nearby Christmas. I have asked several shippers and growers how they expected people to eat those green things? The answer they gave me was: "Oh well, they do something with them." Yes, I will agree that they do something with them. They remain in the retailer's hands until he is disgusted with them and he makes it a point not to touch Florida oranges until he is almost compelled to do so.

We all know that oranges are not like other fruit—when not fit to eat can be used otherwise, for preserving, making pies, stews, etc. We, therefore, should not ship the finest oranges the world has ever produced in a green state, to disgust the lover and patron of our fruit. The only argument I have heard in favor of shipping green fruit was that we dispose of that much, it is out of our way; the first and last cars bring the best prices, and the trade wants it. But how long does that trade want it? Also, how long do those big prices last? Just as soon as those big Eastern or Western cities get in a few cars they say, "No Floridas for me."

Brother grower, don't ruin the market for the sake of a car or two of oranges that you may sell at an advance of 25 or 50 cents per box. You are a big loser in the end, and it costs the State hundreds of thousands of dollars.

There is a pure food law now that may possibly cover that; but I fear not. Now is the time to take steps to stop this evil, and by united effort on the part of the orange grow-

ers we may accomplish it in some way. I do hope some Florida paper will have the backbone to make an issue of it and fight to the bitter end and not wait till several cars have been shipped and then come out and condemn it. "An ounce of prevention is better than a pound of cure."

I personally own nearly 200 acres in bearing grove, and I will not sell a box until it is well colored and fit to eat. But remember that I am only "a drop in the bucket." Let us orange growers unite on this issue and do all we can to oppose it all over the orange belt.

ORIGINAL FEATURES.

AS THE orange shipments from Redlands for this season are now practically at an end, most of the packers are actively engaged laying plans and waging a campaign for the coming season's business. There are many plans under consideration for the improvement of the packing facilities in Redlands. Most of the shipping concerns will follow the same general policy adopted by them in seasons past, The Orange Growers' Cash Association, however, has decided to work next year along somewhat different lines, and embody in its methods of operation some entirely original and new features which appear to be along progressive lines.

The organization will operate on an association basis, becoming strictly a grower's, packing and marketing association. It will employ its own exclusive gangs of pickers throughout the season, to assure uniform care and protection in the handling of the fruit in the groves, at actual cost to the grower. Mr. Hinckle, the manager, remarked that when they put in practice this plan at Highgrove this season, the comparative per cent of decay as to that handled by them in other districts was remarkably small, and the net returns for the fruit decidedly higher.

The association will limit its pack to a comparatively small output so that its growers will have the benefit of being able to ship heavily when the markets are favorable and not be forced to ship under adverse conditions. Their aim seems to be quality, rather than quantity of business.

A new feature will be the control of the organization by a managing board to which the majority of the members will be directly elected by the growers of the association from

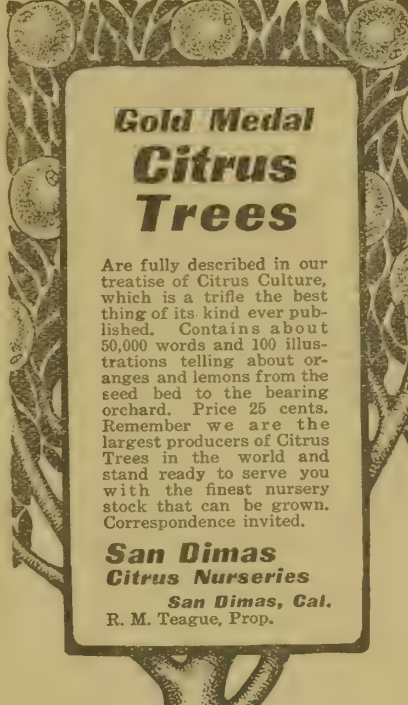

among their own number. This will give the growers the voice, direct management and operation of the business.

Mr. Hinckle believes that through its careful management in picking, its improved methods in handling and packing, that they can deliver their oranges in sound condition without the expense of icing, long after most shipping organizations have been compelled to assume this expense, especially as the Orange Growers' Cash Association will have the benefit of the pre-cooling system which will be furnished them in San Bernarino, by the Santa Fé.

The new organization will retain the name of Orange Growers' Cash Association, under which the old organization has successfully conducted its business—Redlands Facts.

The manager of the Citrus Union testified before the Interstate Commerce Commissioners that he, as agent for the Citrus Union was responsible for the method of distributing cars to orange shippers last season.

Redlands closes its season with more than 3300 cars of fruit, while other nearby sections raise it to nearly 4000 cars. The returns are the most satisfactory ever.

**Gold Medal
Citrus
Trees**

Are fully described in our treatise of Citrus Culture, which is a trifle the best thing of its kind ever published. Contains about 50,000 words and 100 illustrations telling about oranges and lemons from the seed bed to the bearing orchard. Price 25 cents. Remember we are the largest producers of Citrus Trees in the world and stand ready to serve you with the finest nursery stock that can be grown. Correspondence invited.

TWO STATE FAIRS.

California is such a long State territorially, a state of magnificent distances, as Mark Twain once said, that it is extremely difficult for people south of the Tehachapi to attend the State fair held annually at Sacramento.

Why not inaugurate two State fairs, as Ohio used to hold when one was fixed at Columbus and the other at Cleveland. By holding the Sacramento fair the first week in September and the Los Angeles fair a week later, giving time for the removal of exhibits from one place to the other, we would have the entire state represented at both fairs. The attendance would, we believe, be as large at one as the other and the proposition should be a financial success. As it is now the south half of the State has not the representation at the Sacramento fair it should have because the distance is too great for people and exhibitors to attend.

It goes without saying that no better idea of a State's resources can be obtained than from the exhibits that are annually made at State fairs, and it is to the interest of everybody to see that these are representative of the best products in the State. The State fair has become a permanent institution and it is now recognized as the best general means of advertising that has ever been devised. Not only persons who live within the State attend such fairs, but outsiders who are seeking investment for their money. Their impressions of the State are largely based on the products they see exhibited there and naturally they will desire to place their money in the section that makes the best showing. The fact that one locality is better suited to grain raising than another should not discourage farmers who live in other parts of

the State. Probably their land is more adapted to stock raising, or some other branch of the farming industry. It is impossible for any one State or locality to excel in everything, and one branch of agriculture is equally as important as another. By visiting the State fair every year, farmers will soon learn how they can best compete with each other.

By holding two fairs, as we suggest, the people of the entire State would be brought into closer relation, their interests better understood and the magnificent possibilities of the entire State more widely advertised. Ohio made the enterprise win for many years, why can't California?

THE SUMMER SCHOOL.

The Cultivator believes in educating the farmers' boy and girl in the line of practical work cut out for them. If the boy is to follow farming as a business, or the girl prefers farm life to any other kind of life, each should be given the advantage of practical training in the special work desired.

Scientific farming today is the only farming that will pay. Competition is so sharp, public demands are so strenuous on the producer of fruits, vegetables and dairy products, that the farmer must know to a certainty the very best way to produce the very best article if he is to compete in home and foreign markets. The ignorant, half-hearted methods of the old time days will not do for the present, and the failures which are recorded annually among the agriculturalists of the country are directly traceable to a want of proper knowledge on the part of farmers.

So, we say, it is absolutely essential to educate the boys and girls who are to become the agriculturalists of the future in the intricacies of the profession if they are to succeed. The summer courses at our State Universities provide the means for practical education along agricultural lines. Therefore it is important that our boys and girls take advantage of these summer classes to acquire information which will fit them for future usefulness in the field of farm work.

Parents owe it to their sons and daughters to provide them with the equipment necessary for successful competition with others engaged in similar endeavors. It is the best legacy they can leave, for education of a practical character is a lasting source of available revenue.

DAIRY INSPECTION LAW.

During the meeting of the last legislature of California, when the appropriation for the continuance of the State Dairy Inspectors was up for consideration, the Cultivator strenuously urged the passage of the appropriation necessary to continue these officials. This measure, in common with several essential measures, was killed, thus doing away with the State Dairy Inspectors. It is needless to say at this time, that this bill, was one of the most important before the legislature. The health of the community at large was involved. The creameries throughout the State were earnestly advocating the continuance of sanitary inspection of dairies, but in the face of earnest appeals from creamery men from dairy men, both wholesale and retail, the Legislature turned down the appeal. One member of the assembly gave as the reason for his vote, that the "job" of Dairy Inspector is a sinecure for political hacks who have a "pull." Grant this to be true; reports made by inspectors show reasonable exercise of diligence to require dairymen to live up to the law regulating the care and handling of cream.

Today there is no provision for the pay of inspectors, and creameries are at the mercy of unscrupulous or unsanitary dairymen, unless the owners of these creameries go to the individual expense of maintaining the Board out of their own pockets. The community is at the mercy of unsanitary dairies, without any redress whatever, so far as State inspection goes.

Why the Legislature committed this blunder is more than the average citizen is able to understand. It has been stated by a leading creamery that before the creation of the State Dairy Bureau, as high as 40 per cent of the cream received was of an inferior quality and had to be made up

into second grade butter, while under the present system of inspection the amount of bad cream has been very small indeed.

It is asserted that creamery men knowing the importance of inspection and the value to the business of State Dairy Inspectors are contemplating the creation of a fund to keep these inspectors at work. This is very creditable on the part of the creamery interests of the State, but it is a hardship which ought not to have been forced upon them. The Legislature should have made an appropriation for the continuance of State Dairy Inspectors.

There is no advantage to be gained in berating the defunct Legislature at this time. The only thing the people can do is to bear in mind the members of the assembly who voted against this and other just and equitable measures, and so that they do not have the pleasure of again misrepresenting public sentiment on questions vital to the general interest of the community.

There is one thing, however, which must be said for the better class of dairymen; they are earnestly in favor of sanitary inspection, for puts them in a position of independence to protect their interests against any unjust claims of unworthy creamery men.

SECRETARY WILSON'S BIG STICK.

Prof. Wickson, like the rest of us, has a high appreciation of our National Secretary of Agriculture, but in a recent number of his excellent paper the Rural Press, he shies at one of Mr. Wilson's latest orders concerning women clerks in the Department of Agriculture, and wonders where the grave and sedate head of the Department is going to find himself when the women clerks of the Agricultural Department and the women clerks of the country "get busy" about him, as they certainly will do when his order goes into effect.

Prof. Wickson writes in a cautious vein as if he might have had experience along some line which gives him an insight into the possibilities which confront Uncle James Wilson's peace of mind later on. We quote Prof. Wickson:

We have always admired the acuteness of Secretary Wilson and talent for carrying measures along lines of least resistance, but we wonder if he has missed it once. The announcement comes that he has made an order that "no woman clerk under him shall in the future act as private secretary or confidential clerk to a male chief of division or bureau in the department." The order is the direct result of prosecution for leakage of crop statistics by which dealers made vast sums of money. The leakage seems to have been traced to a woman who was confidential clerk, and now Secretary Wilson hopes to prevent it by giving no more women a chance to know important things. This is equivalent to announcing to the country that the Secretary shares the traditional belief that a woman cannot keep a secret, and that is now looked upon as hoary delusion. We presume that Secretary Wilson has suffered more or less by the onsets of equal suffrage advocates and other defenders of the sex. Most public men have had more or less of this sort of attack. If Secretary Wilson has he will soon conclude that such approaches have been merely midsummer zephyrs compared with the cyclone which will now strike him for legislating against a class because an individual proved untrue or because he has told the world that a woman cannot keep a secret as well as a man. On our own hasty judgment is that women have more business conscience than men have, and that to rule against the sex is unwise as well as unfair. It is, perhaps, that of two who will sell information that women will sell for less price, but there will not be difference enough in that direction to increase the likelihood of a bargain. After all the women's clubs and other motive powers strike Mr. Wilson he will conclude that there are bigger sticks than those which are wielded in the national capital.

FINE FOR STANDARD OIL.

The judgment, rendered against the Standard Oil Co., by Judge Landis last week, wherein a fine of over \$29,000,000 was assessed, as penalty for violation of the Federal statutes is the largest judgment ever rendered against a corporation, or an individual, in this or any other country.

It marks a new era of jurisprudence in our national history, and will come as a warning to offenders against the law wherever they may be discovered.

It also comes as a warning to great men and greater corporations; that neither are above the statutes of the land in which they live, and that all men without regard to person, or position must obey the laws to which the humblest citizen is subjected.

News of Country Life in the Golden West

Southern California

Northern California

AGRICULTURE.

Large planting of tobacco is to be made near Downey.

The Colorado River is now falling at the rate of six inches per day.

The Santa Ana River has less water than is usual for the month of July.

Compton beet growers are figuring fifteen tons of beets to the acre.

Five thousand acres of barley have been harvested in La Habra valley.

Orchardmen at Chino are becoming somewhat of a factor in its agricultural economy.

There are 45,290 acres of lima beans and nearly 15,000 acres of small beans in Ventura county.

The Pellesier ranch near Riverside is a new dipping outfit for eradicating the Texas tick.

An agent of the Department of Agriculture is investigating the walnut blight at Oxnard.

Residents of District No. 5 of Imperial Valley are planning for a new cantaloupe association next season.

Six hundred and thirty dollars is being received per carload for spuds from the neighborhood of Anaheim.

One ranch, the San Joaquin, in Orange county has put 6000 acres of lima beans and 8000 acres to the Black Eye beans.

Celery growers in the peat lands near Huntington Beach state there is prospect for the best crop in the history of celery growing.

Chino potato growers are bragging about the fine quality of their Early Rose. J. G. Hartman maintains that output runs forty potatoes to the bushel.

Perris Valley this year has about twenty-five thousand acres in barley, twenty thousand acres in wheat and twenty-four thousand acres in grain and hay.

A Santa Ana company has been formed to produce vegetables, especially celery, on the rich lands near Santa Ana. The company is capitalized at \$200,000.

A meeting of ranchers near Santa Ana was held at that city last week to discuss the advisability of lending encouragement to the establishing of a beet sugar factory.

The Santa Ana Valley Irrigation Company and the Anaheim Union Water Company have joined in the formation of a new company to develop water in the Santa Ana River.

A suspension bridge carrying a long line of riveted steel pipe carrying water for irrigation in Little Rock Creek near Lancaster, collapsed last week. The bridge was nearly one-half mile long.

Various Southern California counties have been appealed to by the Sacramento Irrigation Congress Committee to aid in the entertainment fund to the Congress. So far as reported, all have refused.

Some grain farmers are nettled over the fact that the new law relating to grain bags manufactured at San Quentin prevents the reselling of the bags. For this reason the farmer who is overstocked with bags is compelled to hold over the surplus until he can use them.

HORTICULTURE.

West Highlands shipped 200 cars of oranges this season.

The Yucaipa Valley apple crop will be exceedingly light.

Sixty-two cars of oranges have been shipped from Hemet this season.

Valencias have usually commanded \$3.00 per box f.o.b. cars California.

The Skelley orange packing-house at Riverside was burned last week.

The cantaloupe season at Brawley is ended, with a total of 346 cars shipped.

Rialto has finished its output of oranges this year, with a total of 821 cars.

Nearly 2000 cars of Valencia oranges have been shipped from Southern California.

A. Mills of Anaheim is making strong efforts to bond the county for good roads.

One strawberry grower at Riverside took \$300 from an acre in four and one-half months.

Canners are paying \$40 a ton f.o.b. for freestone peaches and Banning Bartlett pears.

"Gang picking" and pre-cooling are to be factors in next year's citrus output at Redlands.

Fullerton shipped 750 cars of oranges this year, being 100 in excess of former records.

Members of the Whittier Citrus Association will hold their annual picnic the last of this month.

A representative of the Mexican government has been at Riverside gathering information as to citrus culture.

Banning almond growers are being offered 13 cents a pound for soft shell. The crop will be three cars from that point.

A representative of the Japanese government is in Riverside securing information as to its canal and irrigating system.

Walnut growers are much more hopeful for a big crop than earlier in the season, though it is yet too early to predict with certainty.

Fairall and Kunzman of Highland have secured a patent on a measuring appliance to determine the amount of irrigation water in a ditch.

Hemet honey crop will be light. Some report not more than one-fourth of the average, but the price will, in part, make up for the shortage.

Some of the Southern California papers estimate that the total output of walnuts this year will not exceed sixty cars, as against 300 cars in 1905.

The writer in the Riverside Press says that orange box shock will open at about 18 cents, while others predict it may be as low as 13 cents.

A car of Valencias from Peyton orchard at Highlands brought \$1937 at Boston last week. The extra fancy fruit in this car brought \$5.15. The car was precooled.

It is claimed that the Southern Pacific has spent three and one-half millions in closing the break in the Colorado River. Of this, it expects to get back from the government one million and one-half, and one million from the stockholders of the development company, while one million is its own portion in saving its tracks from destruction.

AGRICULTURE.

Tres Pinos will have 156 tons of hay.

The Fresno Health Board is after slaughterers of veal while too young.

Prof. Jaffa addressed the Petaluma poultrymen at their meeting last week.

A new pickle factory at Watsonville is calling for increased acreage of cucumbers.

The individual farmers telephone lines in Yolo and Yuba counties are very successful.

It is estimated that Fresno county's output of poultry will amount to \$500,000 annually.

Kings County Promotion Association is now in full swing doing good work for that rich country.

Reports from various parts of the State indicate the honey crop will be still shorter than anticipated.

The poultrymen of Petaluma have decided upon December 17th to 21st as the date of their poultry show.

The acreage of potatoes about Castroville is less than usual, but the output per acre is rather heavier.

Dixon has finished the shipping of its grain crop and finds the total yield in excess of earlier estimates.

Thousands of acres of feed were destroyed by a brush fire in the eastern edge of Tulare county last week.

A Turlock irrigation district grower harvested thirty tons of muir peaches from ten acres of five-year-old trees.

The Water Consumers' Association of the Turlock irrigation district, held an important meeting last week at Turlock.

Most hop growers are refraining from selling, claiming the short foreign crop gives almost certainty of increase in price.

The Lathrop Hay Company, of Hollister, estimates that valley will have about twenty-seven thousand tons of hay this season.

The Yolo Democrat says that Yolo county offers superior dairying conditions, which are just being realized by its dairymen.

W. O. Leighton, Hydrographer of the U. S. Geological Survey, is investigating the water supply near Corning, Tehama county.

Monterey county reports that with barley at \$1.07 to \$1.10 and hay at \$10 a ton, the farmers life is not so serious as it might be.

The hop market seems to be very uncertain and dealers are taking advantage of this condition to bear the market as far as possible.

Farmers owning lands near Madison, declare the County Assessor has been unjust, and have formed an association to secure justice.

A big pump delivering 133 cubic feet of water to the second has just been installed by the Central Canal Company in Glenn county.

Yolo county's output of barley is estimated to be about three-fourths of the average crop. Prices are ranging from \$1.10 to \$1.15.

"The biggest crop of hay ever known in the Merced section" is the result of this year's farming operations, says the Merced Sun.

HORTICULTURE.

Hanford Cannery is running on peaches.

The Santa Rosa cannery is now running on peaches.

Visalia is boasting of tomatoes two feet in circumference.

A fine crop of peaches is ripening at Guinda, Yolo county.

The first car of grapes from Clovis went forward on the 26th.

Cannery help is scarce is the cry about Yuba and Sutter counties.

It is estimated that the raisin output this year will aggregate 70,000 tons.

The peach crop of Sutter county is surpassing all expectations as to size.

A fruit packing-house at San Jose, valued at \$6000, was burned last week.

The Fresno cannery will have a much larger output of peaches than usual.

Pajaro valley apple crop is now estimated to be much larger than first figures.

One fruit shipping firm at Visalia has an output of about six cars of fruit daily.

Efforts are progressing for Tulare's big fair which will open the 30th of September.

Sonoma county will harvest grapes from seventeen thousand acres of vines this year.

The Parajo valley apples are promising bigger returns this year than at first anticipated.

Turlock cantaloupes have proved successful winners of good coin in the market this year.

Carmelita vineyard near Fresno has been placed under attachment to secure certain debts.

The total shipment of green fruit from Vacaville aggregates three hundred and seven carloads.

Pears in the Sacramento valley, while lighter in crop, are said to be finer in quality than usual.

Hanford claims a new peach which is named the Muir cling and is said to be an exceptionally fine peach.

Fresno Home Packing Company is the name of the new packing concern with a house established at Visalia.

Large quantities of green peaches are being shipped from Hanford to canneries in other sections of the State.

The Southern Pacific shipments of products from the little town of Clovis aggregated nearly \$14,000 for one week.

A cluster of thirty-nine Belle-fleur apples in one bunch is exhibited at the Watsonville Board of Trade rooms.

The Ukiah Times says that the first grapes of the season were Sweetwaters, and were received from Imperial.

Parajo valley fair which has promised to be an exceptionally good agricultural fair, is to be held at Watsonville in October.

The packing houses at Watsonville are busy places these days getting ready for the exceptionally big pack of this fall's apples.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultry men who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.; My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Fitcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

AROUND THE YARDS.

Get your birds through the molting early.

Keep plenty of charcoal and grit before your fowls.

Green food is a necessity at the time of year.

One breed of chickens is, as a rule, enough for a ranch.

The object of caponizing is to improve the quality and increase the quantity of the flesh fowls. It must be done while the fowls are young however.

What to feed, when and how to feed are important things to know about poultry.

If you have not already culled your birds do so at once, don't feed the non-producers.

Take special care of the nests keep them clean, inviting and free from vermin; unless you do, the hens will not take to them kindly and will lay on the ground around the yards, which will encourage the habit of egg eating.

The domestic goose was brought over from Europe by the early settlers, and is not even related to the common wild goose of the United States; on the contrary, the quail and partridges of the United States are indigenous species. While many attempts have been made to introduce the European quail and partridges these birds are still very rare.

On this coast, especially in Oregon and Washington, several species of pheasants from Japan and China have been turned out to shift for themselves and have become very abundant.

SQUAB CULTURE.

Not many years ago the barnyard hen was considered a very unimportant asset to the ranch and was only tolerated because of the few eggs she laid in early springtime together with the few chicks she brought off from a three-weeks setting in a nest she had stolen out somewhere. Today things are different; the hen is one of the most valuable acquisitions of the farm, paying for herself together with 100 per cent profit on the amount invested in her.

As the hen once stood in the eye sight of the rural districts, so stand the pigeon today: Little understood, of little value, apparently, allowed to go in and out at will and kept by the few poor squabs it will produce under conditions not calculated to give good results. Yet, Mr. Rancher, you will find in the pigeon as great a wealth-producer as you have found in your barnyard hen, if you will improve its conditions as you have improved that of the hen. The game birds of our country are fast passing away. The law keeps them off our tables the larger portion of the year and when the law lets down the bar and permits killing, the hunters cannot supply the demand for the supply does not exist.

Can We Sell Them?

The demand is continually on the increase. The pigeon steps in and offers to supply the demand and the offer is cheerfully accepted in all

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

JULY INCUBATOR CHICKS.

A SUBSCRIBER asks why June and July incubator chicks should be inferior to earlier hatches.

This certainly is an important question and one that should be considered from many points. Our first thought would naturally be, if June and July hatches in incubators was unprofitable and that the chicks were inferior to earlier ones; that the trouble was in the incubator and that when the warm days of summer came we might as well store our incubator, shut up shop and quit for the season. Perhaps many who have tried to hatch at this time of year will say the same thing for hatches are very unsatisfactory and especially so unless we begin farther back than the incubator.

We all know that to hatch strong, healthy chicks we must have strong, vigorous parent stock; that special care should be given to food and general condition that we may get fertile eggs.

Fertility of Eggs.

The first thing for us to consider, if we are going to hatch chicks at this season of the year, is the male bird; we all know or should, that a bird that was put in the breeding pen, say in January, and has been with the same females will not fertilize so many eggs, as he did when first mated. Many male birds at this season of the year are not nearly so active as at first. Examine your birds and see if they are not thin, really too thin to be in a breeding pen, even should he be in good condition; he has become so well acquainted with his mates that the percentage of fertility is far too low for good results. Then let us also consider the females that have been laying, say six months; the eggs are smaller than at the beginning of the season, and although a small egg may hatch, do we consider it as good for incubation as a larger one. To insure good results we would suggest that you change your male bird every few days from one pen to another or better still, if you have two males put them in pen on alternate days, giving them special care when not in pen.

Care of Incubator.

You should have a place for your machine where you can control the temperature. An incubator cellar is best, but should you not have this, put it in the basement, or in an inside room. Unless you watch the heat very closely it will run too high. Which will have a negative influence on your chicks.

If you will consider these points and give your chicks proper care and feed, as has been mentioned recently in these columns, you may expect good results even at this season.

Pick out your two-year-old hens and dispose of them in the market. They will never pay for their keep if held over. The only time it is advisable to keep old hens is when they are remarkably high-scoring and are kept for their value as breeders.

cities. Hence I state with emphasis that the business of raising squabs for market is not a delusion or a snare as so many are inclined to believe. It is really a field of profitable and safe investment. The fact that men who were wholly unversed to the pigeon business in any of its branches have rushed headlong into the squab business and made colossal failures of it, is not a proof positive that there is no money in the raising of squabs for market; I know there is good money to be made in this branch of the pigeon industry. The fact has been clearly demonstrated on many of the successful squab plants scattered all over the country. I once doubted this. I was very much like the old lady who, with many others, was viewing the first of the steam engine. The engine was standing on the tracks, puffing from its different valves making a great noise; the old lady asked about it many times; she put her hands on the drive wheels and it paused and shook her head, then turning to the crowd, she exclaimed: "It will never go, it will never go." After a little while, the engineer took his place; he tested the different parts of the machine to see that they were all right, then in answer to a signal blew a blast from the whistle and slowly allowed the steam to escape into the cylinders. The machine started, the engineer opened the throttle wider, more speed was attained. The old lady rushed to the track, she shaded her eyes with her hands so that she might view the machine the longer. After a time it passed from her view. She turned to the crowd throwing her hands in the air exclaiming: "It will never stop, it will never stop!" As the old lady was with the engine, so was I and many others. We loved the fancy pigeon for itself, not for a profit. Others loved the pigeon for the profit and started large operations to supply a demand which did not believe existed. We call it a fad and said it would never go. Now we too see the demand and say, in excitement, but after careful study, it will never stop. I firmly believe the squab business is destined to be one of the most profitable ventures in the list of good things for the table. There is much to learn (there always will be) but the demand exists and active brains are at work solving the problem of success.

Use First and Then the Birds.

The requirements of the pigeon is expensive. The loft can be arranged in the upper story of the barn, such is handy, to accommodate 50 pair and this is all that should be allowed in one colony. Select a shed eight by twenty, six feet high in rear, eight feet high in front. Batten the cracks, face the building to the South or S. E. Arrange two nests for every pair of birds with small space between each pair of nests to avoid fighting. A loft should be built six feet high, twelve feet wide and twenty feet long covered over with wire, thus keeping the birds enclosed as they will do better confined. Yet, if convenient to do so, it is well to liberate them once in a while for exercise, but this is not necessary.

Selection of Birds.

As we have the house we must now get the birds. This is an important movement. What kind shall we get? There is the Homer, the Runt, the Maltese Hen pigeon; also the Runt-Hen cross, produced by crossing the pure Runt pigeon on the

Maltese Hen. The Homer is a hardy little bird standing confinement well. Producers say, seven pair birds in a year, the dozen weighing from eight to nine pounds at four weeks old. Value on the market from \$2.50 to \$3.50 per dozen. The squabs are a very light color, not showing many pin feathers, easily cleaned and sell readily.

The Runt is not so hardy as the Homer nor does he produce quite so many squabs per year. If it averages four pair per year it does well. They weigh well one and one-half pounds each at five weeks old and bring readily \$6.00 to \$7.50 per dozen. They are in demand in private families and clubs.

The Maltese Hen Pigeon.

No pigeon is more hardy, none more prolific, producing an average of seven pair per year weighing from twelve to sixteen pounds per dozen. Meat plentiful, extra fine in tissue and plenty just where we like to see it, on the breast. They are in great demand and the few squabs that get to the market readily sell for from \$3.50 to \$6.00 per dozen.

The Runt-Hen Cross.

Just the thing for high-class trade; a cross of the Runt and the Maltese Hen, creating a pigeon as hardy as the Homer, having the wonderful breeding power of the Maltese Hen pigeon, with the great size of the Runt. Young ranging from fourteen to eighteen pounds per dozen. Always in demand on the market selling at from \$4.00 to \$8.00 per dozen, according to season. Price generally prevailing with breeders are: Homers, \$1.50; common Runts, \$5.00; Maltese Hens, \$5.00; Runt-Hen cross, \$3.00.

Feeding.

The feed need not be expensive, but must be clean and wholesome, consisting of wheat, Kaffir corn, yellow corn, with plenty of gravel or grit. Water should always be supplied in abundance as they love the bath and where bathing is permitted freely the birds are seldom bothered with mites or lice, at least never to the extent that chickens are.

Advice to Beginners.

If a person has not a natural liking for pigeons, if he is not painstaking, economical and persistent, he will not succeed. In this day, when competition is so great, a man to succeed in almost any business must stick to it closely, employ the best appliances and watch every point.

I would advise those who think of going into the squab business, who have had little or no experience with pigeons, to go slow—to buy a few pair, study their requirements and learn how to handle them before they jump into it by the hundreds of pairs: spend a year in experimenting if needs be. This is straight, honest advice. Of course, you want to be up and doing, but there is no great hurry. Our people do not consume one-half as much of this kind of produce as do the European nations, but are fast falling into line; more and more, squabs will be demanded each year, and you want to be able to handle your share in a skillful manner.

None of the breeds I have mentioned nor any other breed can produce one pair each month. Some advertise ten pair as an average, but I should rather deal with the man who considers six or seven pair a good average, for he certainly talks like a man of experience, but the amateur has to prove all these things, battle with disease, moulting season,

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

mate up birds, understand loft registers and a thousand and one other things that it will pay the best to learn on a small bunch of birds rather than a large bunch. As a parting word, I would say, apprentice yourself to the industry for one year, and while you will not learn it all, by any means, you will get an insight into it that will help you to succeed.—W. E. Foster, Fillmore, California.

LOS ANGELES COUNTY ASSOCIATION.

The annual meeting of the Los Angeles County Poultry Association corporation was held on the evening of July 20 in the city of Los Angeles. Of the thousand shares constituting its capital stock, 634 were represented at the meeting, including many of the leading breeders and fanciers of this section. The new board of directors chosen is as follows: W. Lewis Sly, Los Angeles; Harry E. Rose, Alhambra; George Shrader, Pasadena; A. J. Little, Monrovia; John D. Mercer, Los Angeles; C. F. Jones of Hollywood and C. D. Hubbard of San Fernando.

The officers elected are: Mr. Sly, president; Mr. Mercer, vice-president; Mr. Hubbard, secretary and Mr. Rose treasurer.

The annual show will be held December 9 to 14 inclusive. It will be judged by comparison.

POULTRY BREEDERS ELECT.

The annual meeting of the Poultry Breeders' Association, of Southern California, was held July 25 in Assembly Hall, Chamber of Commerce building, with about fifty members present. The following officers were elected: President, Dr. C. E. Winslow, Monrovia; first vice-president, L. E. Berkey, Fullerton; second vice-president, Ed. M. Burnell, South Pasadena; secretary, H. A. Meserve, Los Angeles; treasurer, Charles Andrews, Hollywood; board of directors, L. E. Berkey, L. R. Walton, Dr. C. E. Winslow, Ed. M. Burnell, Frank Ironmonger, H. W. Gunston, H. A. Meserve, Charles Andrews and J. L. Harrison.

The second annual show will be held at Chutes Park, Jan. 6 to 12, 1908. It will be a score card show.

EGGS ARE ALWAYS IN DEMAND.

"Been a-thinkin' fer some years,

Wot would happen to us here,

If all the hens should up an' die.

Haven't solved the problem yet,

Whar 'ud be our eggs to fry,

An' delicious omelet.

"Wot 'ud wimmen have to make

Oil of their delicious cake,

An' ice cream, of which they boast?

Whar 'ud be our eggs to fry,

Boil an' scramble, poach, an' roast,

If the hens 'ud up an' die?

"Then the puddin' 'ud be done,

An' the gingerbread, and bun,

Fritter, muffin, johnnycake,

Pumpkin pie we all like so;

Gems, there'd be no eggs to make,

An'—no ancient eggs to throw.

"There'd be no popovers then

Fer to please the kids and men;

Cookies, doughnuts, and the like,

In a long an' endless line;

Every one 'ud up an' hike,

Leavin' us to mourn an' pine.

"Man can imitate the bee,

An' make honey good as he;

'Dulterate most everything.

I don't have to pardon beg—

It is truth, sir; but, by jing,

Science cain't produce an egg!"

NOT EVERYTHING.

"Why do you have everything in your wife's name?"

"I don't. We have our children in my name."

Bees and Their Care

BOTTOM VENTILATION.

IN my last communication, answering an inquiry from my Morgan county friend, I mentioned the ventilation of the hive by inserting a wedge between the bottom board and the brood chamber, writes R. A. Holekamp in Coleman's Rural. This being the season of the year when we may expect hot days, I consider ventilation of enough importance to write about it here more fully.

To prevent swarming at the season of the year when the bees are gathering their main surplus crop is the aim of the beekeeper who prefers honey to increase.

There are different ways of preventing swarming, and it is not the purpose of this article to consider the different treatments given the bees by experienced beekeepers to accomplish this end; ventilation assists in keeping the bees comfortable when they become numerous and to a certain extent prevents or retards swarming when they have been provided with plenty of room in their hives.

The hive bottoms as usually sent out by manufacturers of beekeepers' supplies have an entrance three-eighths of an inch deep. It is made by nailing a strip three-eighths of an inch thick by about seven-eighths of an inch wide on the face of the two long sides of a board of the proper size, while the back end has a cleat which extends three-eighths of an inch above the face of this board, forming a rim on three sides three-eighths of an inch high for the hive body to rest upon, leaving the front open and forming the entrance three-eighths of an inch deep by the width of the hive. In winter and during the cooler part of the year this entrance is ample, but when the hot days of summer come we can see by the action of the bees that they are uncomfortable in their hives.

In late years the manufacturers of bee supplies have sent out bottom boards which are reversible, having on one side a three-eighths inch entrance, while the other side is made for a seven-eighths inch entrance.

Apparently these bottom boards fill the bill. They give the desired large entrance, but there are drawbacks to them. The writer has used a number of these bottom boards, but is discarding them now; he has found that the bees in some cases will build comb under the bottom bars of the brood frames, making it impossible in the fall, when it becomes necessary to contract the entrance, to reverse the bottom board without first taking out the frames and cutting off this comb attached to them. In other cases they will build comb on the bottom board to fill the large space between bottom board and frames and still in other cases again they will build numerous ladders on the bottom board.

Another objection in this locality is that when I wish to turn the bottom board in summer to give the bees the large entrance I find this side which has been on the stand towards the ground covered with a thick coating of all kinds of cocoons and web fastened there by different insects, which to remove causes considerable labor. All these advantages and drawbacks are overcome by the wedge-ventilator, which I will describe here again. I go to the planing mill and order to be cut out of inch boards nineteen inches long, wedges, one inch thick at one end

and running to featheredge at the other. It requires about one inch lumber for a wedge, therefore the expense of having them made is small.

The wedges being prepared, I go to my hives with the lit smoker, blow little smoke into the entrance, insert a large framing chisel and lift the brood chamber in front sufficiently from the bottom board to slide the wedges under it and on top of the 3-8x7-8-inch board on the face of the bottom board described before.

I stated that the length of the boards out of which I have the wedges ripped is nineteen inches. This is one inch shorter than the hive body.

When I slip the wedges under let them reach in the rear only within one inch of the length of the hive, this causes the brood chamber to rest on the wedges and on the cleat at the rear end of the bottom board.

The work of slipping the wedge under the brood chamber requires very little time. I adjust the wedge under a hundred hives in less than an hour, at the same time noticing whether my hives need any leveling up.

I also wish to mention here that enlarging the entrance with the wedges the bees do not build a comb for me under the brood frames nor do they build ladders nor come to the bottom boards, as the frames in the rear of the hive are the same as if their entrance had not been enlarged.

THE PERVERSITY OF BEES.

If bees would only swarm when they had nothing else to do we could look upon the new colony as so much clear profit, but that is just what they will not do. They will swarm only when the honey season is best, and then, day, or, more often, several days, are lost, both by those that go out at those that stay in the hive, just when time is most valuable. Swarming can be delayed or entirely checked by cutting out the queen cells, but this makes necessary so frequent disturbances to the bees by opening the hive and lifting the frames that we sometimes think it is almost as much hindrance to them as to swarming. By having hives all ready and frames filled with old comb, or full sheets of foundation the new colony will be ready for business the next day after they take possession. If bees seem to be clinging to the outside of the hive, as if near ready to swarm, yet do not, feed them at the top of the hive, under the cover and they will go in and proceed to put away the syrup, but will be ready to go when the queen is ready.—Inana Farmer.

This is a good smoker fuel and every beekeeper can have it: It is given in Coleman's Rural. Mix a couple handfuls of saltpeter with a gallon of water. With this solution saturate old gunny sacks thoroughly; wring them dry, and when dry roll them in rolls just thick enough to loosely go into your smoker. Tie these rolls with strings every 3 or 4 inches and shove into cartridges, not quite as long as the firebox of your smoker is deep. Prepare enough of these cartridges to last you all summer, and keep them dry and in a handy place.

EXCELLENT PAPER.

C. T. Ingram, of Pasadena, writes "The California Cultivator is most excellent paper."

Irrigation and Forestry

IRRIGATION CONVENTION.

THAT the work of the Reclamation Service receives criticism and may be worthy of criticism, not unthinkable. That any body of men should take charge of such vast expenditures as has been placed in their hands and not create enemies, is hardly probable. In any case, the criticism is now being given in regard to the Laguna Dam near Yuma. The settlers under the Yuma Valley Consolidated Water Users' Association and has issued a call for a convention to precede the National Irrigation Congress to be held in Sacramento, in September. This convention to be August 31. In the call quite serious charges are made against the service, which it is entirely probable a frank discussion will clear up, and if it does not it will be well to know as to the truth of the charges.

Amongst other charges are these: The Reclamation officials induced the owners of land under the proposed Laguna Dam Irrigation system to sign away their property rights and interests by false promises and misrepresentations, and because of this we have banded ourselves together for self protection, and have formed the Yuma Valley Consolidated Water Users' Association, for the purpose of protecting our rights and getting justice at the hands of the government.

We charge and can prove that the Reclamation Service made false representations to the settlers in the valley in order to secure our signature to a contract whereby we have mortgaged our homes to the government for an unknown amount, and that the estimated cost of the irrigation works to be constructed were grossly misrepresented.

We charge that J. B. Lippincott and his associates representing the government estimated that the Laguna Dam would cost about \$900,000; that a contract to construct the dam was made with a responsible firm; that after doing a large amount of work that firm surrendered its contract sustaining a loss of about \$320,000; that up to the present time there has been paid out on the work of construction about \$920,000, of which amount \$600,000 was paid by the government and the remainder was the loss sustained by the contractor; that the work at this point was about half done. Thus the dam when completed will have cost nearly \$2,000,000, to say nothing of the syphon under the Gila river, the tunnel through the Yuma mesa and the distributing canal system to irrigate the 87,600 acres of land—the total cost of which is now believed will aggregate not less than \$70 or \$80 per acre.

Regarding the aim of the convention, the call says:

In order that all such delegates may have an opportunity to confer with each other and discuss the vital questions in which we are all interested and take appropriate action regarding the subjects discussed, we hereby invite all such delegates who believe that the Reclamation Service should be thoroughly investigated by the government, with a view to correcting the evils complained of in this call, to meet in convention in the city of Sacramento, California, on the Saturday August 31, 1907 at 10 o'clock a.m.

It is proposed to place before this

convention a proposition to memorialize the President to order a thorough examination of the Reclamation Service, to the end that the facts of the case may be made public; that such changes may be made in the personnel of the service as the facts may require, and that proper restrictions may be placed upon the service and proper rules adopted by the government for its guidance that will give the public confidence in this great work of reclaiming our arid lands and making homes for American citizens and their families.

We also ask that steps be taken at such convention to place the entire question before Congress if such course shall be deemed expedient. The convention will also be competent to consider such other questions connected with this subject as may be brought up for consideration and to take such action as the merits of the case may dictate.

L. M. Holt, of Los Angeles, is secretary of the organization.

SUGGESTIONS FOR FOREST PLANTING ON THE SEMI-ARID PLAINS.

The Forest Service has just issued a circular devoted to the interests of forest planters. There is real need for forest growth. By careful selection of the species, the choice of suitable sites, and proper management of plantations, enough forest can be grown to exercise a marked effect upon farm development and to supply wood for most domestic purposes. The object of the circular is to show just what is practicable to undertake in the way of such plantations. Planting may be done for any one of three chief purposes—protection, wood supply, and shade.

A windbreak consists of one or two rows of trees planted primarily for the purpose of checking the force of the wind. The term "shelterbelt" is applied to larger groups of trees, which form forest conditions and serve a protective purpose. Any species which is adapted to the region may be used for wind-breaks. Where evergreens will succeed, however, they are more desirable, since they afford better winter protection than deciduous trees. A windbreak consisting of a single row should be composed of a densely growing species with branches close to the ground.

The main use of windbreaks is to shelter an orchard or a residence site, to prevent hot winds from scorching field crops, and to conserve soil moisture within the protected area. They may also be planted in open pastures for the protection of stock. Incidentally, the windbreak may furnish useful material, but it must be placed where it will afford the most effective protection, without much reference to the character of the soil.

Wherever agriculture is practiced in the plains region, the farmer will find it profitable to devote a few acres of good land to trees. It is true that sometime must elapse before the plantation will become productive, but, by the choice of rapid growing species and by close spacing, the thinnings which will be necessary in a few years will provide material suitable for fuel, stakes, and the like.

The choice of species for this purpose is naturally very limited and will depend somewhat on the location.

Sharpened to Stay Sharp

Tools for use in the home or on the farm must have lasting edges and fine temper, for they are called upon to do all kinds of work and do it well.

The most satisfactory tools for the home or farm—tools that seldom need grinding, tools whose adjustments are right and stay right—are

KEEN KUTTER

Tools and Cutlery

the only complete line of tools under one name, trademark and guarantee.

To remove all chance from tool buying, ask for Keen Kutter Tools and look for the trademark on each tool.

Keen Kutter Tools include Saws, Chisels, Bits, Drills, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Screw-drivers, Files, Pliers, Glass-cutters, Ice-picks, and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass-shears, Rakes. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

Keen Kutter Tools have been sold for nearly 40 years under this mark and motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Trademark Registered.

SORE SHOULDERS

I would like very much to personally meet every reader of this paper who owns any horses that have sore shoulders and tell him about Security Gail Salve. This is impossible so I am going to tell you through the paper.

You and I both know that horses working with sore shoulders are in pain, and that they can't do as much work without running down as when they are free from pain. I also know perfectly well that Security Gail Salve will cure these shoulders, but you do not know it. If you did you would buy a box of your dealer at once and cure them up, for you have no doubt often wished that you knew of something you could rely on. You can rely absolutely on Security Gail Salve. It will do its work every time, or if you prefer to try it first I will mail you a sample can free. Just write for it—it will go to you on first mail.

Also I want to tell you that Security Antiseptic Healer is as good for barb wire cuts as Security Gail Salve is for harness galls. Dealers carry them in 25c, 50c and \$1.00 sizes. Use them for your needs; I guarantee you perfect satisfaction.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Callas not Blooming.

I came from the East a couple of years ago where all flowering plants had to be lifted. Since coming to California, I have a row of Callas and I hardly understand their culture. They bloomed freely last winter, then the leaves died down and though they have plenty of water, do not start again. Should I have taken the bulbs from the ground when they quit blooming? Should they be divided this fall? Do they need a fertilizer?—Mrs. L., El Centro.

It does no harm to give the Calla a well-earned rest through the summer. As a rule, however, if given plenty of water, they will bloom, though much less profusely, through the summer. But in your section the greater heat may prevent it. They love the shade, which, if you can give them with plenty of water, you may keep in bloom all summer. We note that you say you have watered well. But have you? That is, have you soaked down deep into the soil? A soil that has had no rain for months and greedily takes away every drop of a light, ordinary irrigation. Soak, mulch and shade for summer growth.

You may divide or not as you prefer, but it is not necessary unless they have been in ground three or more years. Fertilizer may be given to encourage larger bloom, but in your rich soil should not be necessary. A row in the garden of the writer is yet blooming, but the larger and finer blossoms, but the larger of a large tree.

Your strawberry query will be answered by Mr. Lobingier later.

Not Shot-Hole Fungus.

This department recently had a query as to plum leaves, which had holes and burned spots much resembling shot-hole fungus. In answering those the suggestion was made that early application of Bordeaux this fall might be of value. The query was sent to Prof. Ralph E. Smith and he replies as follows:

"I have recently been up in the Fresno region looking into the leaf-spot trouble of plums to which you refer in your letter of the 22nd inst., and also had the same thing come up last year. It looks very much, as you suggest, like a shot-hole fungus effect, but I find that the disease is not due to any fungus or parasite at all, but is an effect of entirely different agencies.

"This trouble is an effect of unfavorable water conditions in the soil, coupled very often with alkali injury. In many parts of the San Joaquin they have had a very unstable water level in the soil in recent years, the water rising and falling suddenly and very decidedly. The roots of the trees which normally have been growing in rather dry soil near the surface have been submerged in water, then perhaps dried out again, and then submerged again, especially in the last two wet springs. This has been particularly disastrous in the poorer drained regions, where water accumulates and does not run off readily.

"Spraying is of course quite useless for this trouble, and nothing can save trees which are too badly affected. In case they are not so far gone, showing only die back in the top and spotting and dropping of the leaves, I have advised cutting back quite heavily in order to give the roots a chance to renew themselves and hoping to form a new top in case the

unfavorable conditions do not occur soon again."

Bringing to Her Milk.

Our cow, bred last September and milked up to a couple of weeks before freshening, but now gives hardly any milk. She seems to feel good and is getting fat. She is staked on alfalfa; when milking her we give her a little wheat hay, carrots or parsnips. Please advise me what to do to get her to give more milk if there is any way, and how much milk should a calf have and how often, and is there anything else I could give it? Cow ate after birth; would that have any effect on her. Her bowels move freely.—Mrs. C. W.

This cow should be fed on a mash of bran salted and made as wet as she can be induced to take it. Adding a little oil cake will help. Cut down the wheat hay as much as possible; keep water before her all the time as the salted bran will induce thirst, and the more water she drinks the better for the milk secretion. In last week's Cultivator you will find a like case the full description for manipulating the udder to help the flow. Give the calf new milk three times a day for the first week then add skim milk and hay tea. The hay tea is made by covering alfalfa hay with hot water for half an hour; add this to the skim milk and feed it warm. A tablespoonful of flaxseed meal cooked to a gruel and added will perfectly supply the nutriment. Feed a calf only until its sides are level, not puffed out; indeed there is more danger of over-feeding than under-feeding. Have the calf in a shed away from flies and keep in the shed a manger with some dry bran slightly salted and plenty of fresh drinking water.

It is natural for a cow to eat the afterbirth. This one of Nature's wise ways that we do not understand. Darwin suggests that it was at first a way of protection, as the odors were destroyed, and the wolves could not smell the fresh blood and seek the calf. It will always be considered as showing that there is a Divine mind somewhere that cares for the animals, when we consider the wonder of a grass-eating animal turning to meat eating for once on the occasion of its motherhood.

Crude Carbolic Acid.

I am advised to use crude carbolic acid for a disinfectant and lice killer sprayed on hen house. Will you please tell through the paper where I can get crude carbolic acid, as the local dealer here seems to know nothing about it, and about what will it cost per gallon.

You can get crude carbolic acid from poultry supply houses or at nearly any drug store. It should be diluted with water about seven parts to one of acid.

Book on Soils.

Will you please recommend some good book, for a beginner, on the composition and treatment of different soils?—H. G., Rialto.

"Soils," by Hilgard, published by McMillan Co., New York, is a scientific presentation of the subject.

General Agriculture

THE SAN JOAQUIN RIVER.

THE value of the commodities last year carried over the San Joaquin river between here and Stockton over \$28,000,000, as computed by Stockton Chamber of Commerce, is the editor of the San Francisco Chronicle.

The tonnage of the vessels one way the year aggregated nearly 512,000 tons net. And yet, in spite of this very large traffic, no seagoing vessel can reach the Stockton wharves. This is particularly onerous in the case of lumber and similar materials for which there is a large demand at Stockton and the territory tributary to it and which must all be reshipped to this city.

That condition ought not to exist. It may appear to be advantageous to the merchants of this city, but probably it is not and, at any rate, it is unprofitable to Stockton and the people of the San Joaquin valley. It may not be profitable and, at any rate, it is not proposed to make Stockton accessible to deep-sea ships, but it is proposed to dredge a channel to fifteen feet, which will admit most coasters. The result will be to cheapen lumber and many other commodities in Stockton and promote commerce between that port and the Coast points. It will enable the shipping interests to reach all Coast points direct and, in fact, all points which can be profitably reached by ships drawing not more than fifteen feet.

What that is required is the dredging of the channel seven miles through the flats from deep water on the San

Joaquin to Stockton. Congress at its last session ordered a survey of this channel preliminary to the actual execution of the work, which will presumably be ordered in due course in the next river and harbor bill, and perhaps at the coming session.

If there is water to fill the channel, if made, the dredging should be continued some distance up the river. All the railroads of the country are choked with traffic and every waterway that is worthy of improvement should be made available. Doubtless in the San Joaquin valley water is more valuable for irrigation than for navigation to the extent that it is required, but a channel is worth making even for use only half of the year. Whenever a channel can be made which can be traversed by flat-bottomed steamers or barges, even for only part of the year, the work should be done, whether on the San Joaquin river or elsewhere.

PREVENTION OF SORGHUM AND KAFIR-CORN SMUT.

The most common smut of the cultivated sorghums is what is known as "grain smut," caused by a fungus allied to the smut of corn, and which grows entirely within the tissues of the plant, becoming externally evident and most active in the flowering head, where it consumes the food material intended for seed formation. At maturity the affected heads considerably resemble normal heads in appearance, but in the interior the seed kernels are almost entirely replaced by a mass of olive-brown, dusty "spores," the reproductive

bodies of the fungus. These spores germinate when the seeds are planted, sending forth slender germ tubes, which infect the young germinating grain by growing into the delicate tissues. Within the host plant, the fungus consists of very minute, slender threads, the mycelium, which penetrate all the soft parts of the growing stem. The results of the activity of the fungus do not become manifest until the head appears. The injury done lies in the destruction of the developing seed, and (in sorghum) in the reduction of the sugar content of the stalk. The Jensen hot-water treatment of the seed has been found effective, but it is cumbersome and inconvenient of application.

Experiments this season, conducted by the Botanical Department of the Experiment Station, indicate that formaldehyde is an effective means of prevention when the smutted seed is soaked for twelve hours in a solution of one-fifth of one per cent of formaldehyde in water (one pint of formaldehyde to sixty-two gallons, three pints of water), or for two hours in a solution of one-half of one per cent of formaldehyde in water (two pints of formaldehyde to forty-nine gallons, three quarts of water).

The check plots in this experiment yielded 33.4 per cent and 27.8 per cent of smutted stalks, respectively, as against none at all for the same seed treated with the percentages of formaldehyde mentioned. On account of the lesser time required for soaking, the second or stronger solution is recommended. After soaking, the seed should be spread out upon a clean floor and turned occasionally until dry.

Commercial formaldehyde is for-

maldehyde gas held in water to saturation. Such a solution has a maximum strength of 40 per cent. The percentage solutions recommended in this bulletin are percentages of the 40 per cent solution.

In treating the smutted seed, allow three pints of the formaldehyde solution as made up, to cover four and one-half pounds of the seed, or about four and one-half gallons to the bushel of seed. The same liquid may be used over and over again, so long as the seed is kept covered. The most satisfactory method of procedure is to hang the smutted seed, enclosed in a loose burlap bag, within a barrel into which the formaldehyde solution has previously been poured. Cover top of barrel to retain the fumes of escaping formaldehyde gas as much as possible.

Forty per cent formaldehyde is a liquid retailing at thirty-five cents per pound (pint). The cost of the treatment by using the one-half of one per cent solution would be about six cents per bushel of seed for the formaldehyde used.—H. F. ROBERTS of Kansas State Agricultural College.

Studebaker Wagons

No one ever claimed to build a better wagon than the Studebaker.

Why?

The originator of California Wagons was Mr. J. M. Studebaker, President of the Company, who worked as a wagon maker when in his shop in the mines in this state.

They last longer and run easier than others because he designed them to withstand the peculiarities of our climate and proportioned them properly to carry the heavy loads common to this section.

Our stock is complete. We can furnish wagons of suitable size for any work.

Let us show them to you at our salesrooms,

Kellogg's Ant Paste

Lompoc, Cal., July 19, 1906.
Mfr. Kellogg's Ant Paste:

Dear sir—I have been tormented with ants for years and they seemed to get worse every year. I saw your ad in the Cultivator and sent for a bottle tho' I admit I hadn't much faith in it. In fact, kept the bottle in house a week before I tried it. One afternoon I used the Ant Paste according to directions and the ants didn't pay much attention to it and I thought it was a failure like everything else I had tried, but next morning there wasn't an ant in the house. I could hardly believe it. It seemed like magic. I wish every one bothered with ants could hear of and use Kellogg's Ant Paste.

Mrs. Francis Burbridge.

IN THE COUNTRY WHERE DREAMS COME TRUE.

Afar in the misty distance,
Quite hidden from curious view,
The home of my heart is waiting
In the country where dreams come true.

Its walls are not bricks and mortar,
But shapely and perfect it grew;
For fancies are firm foundations
In the country where dreams come true.

O, it isn't a stately mansion;
There's only just room for you;
But there's many a precious jewel
In the country where dreams come true.
When the nights are long in passing,
And days are vexatious, too,
I think of the treasure waiting
In the country where dreams come true.

Then the darkest nights grow golden,
For I'm living alone with you
In the home that my heart selected,
In the country where dreams come true.

—Ella Middleton Tybout in Lippincott's.

TOMMY AND THE TIGER.

Continued from Last Week

THE kitchen door was open and the warm sunshine streamed across the floor. She stretched in this sunny pathway and lay there her yellow eyes on the boy and her heavy tail thumping the floor.

"Hungry, kitty?" the boy asked her.

The tiger purred and yawned again with a great display of red mouth and yellow fangs.

Tommy took the saucer of cookies from the table and emptied it close to her. She ate them greedily. Then he remembered there was some cold meat in the pantry. As he lifted it down from the shelf he looked around. The tiger was standing in the doorway watching him. He gave her the meat and she speedily cleared the plate.

Then it occurred to Tommy that she might be thirsty too. The pump was on the porch close to the kitchen door. There was a pail beneath the spout. He went out and filled it and the tiger waited for him in the doorway. He brought the pail into the kitchen and she drank greedily.

Then she laid herself down in the sunshine again and there being nothing further for Tommy to do he sat there in his mother's low rocking chair and watched her.

It was a warm day and there was something soothing about the heavy air. Tommy had quite recovered from his fright. He felt almost comfortable. The reaction from the agitation made him strangely tired. The bit of the sky he could see through the open door wavered and swayed, the stripes on the tiger's coat seemed to run together, his head nodded forward and then nodded back—and stayed there. Tommy was fast asleep.

He was awakened by a strange sound of swishing water. He opened his eyes quickly. The tiger was finishing the water in the pail.

Then she looked around and saw that he was awake and purred as if in satisfaction. And suddenly a great idea came to Tommy's refreshed mind.

It was a great idea, and it was a daring idea. He would earn that \$100.

He remembered what his father had said about the doctor's bills and

the taxes. A hundred dollars would be a great help. He was no longer afraid of the tiger. She was no more to him now than a clumsy kitten. He arose and took his hat from the nail behind the outer door. The tiger watched him lazily.

"Come, kitty," he said.

She slowly arose and stretched herself and noisily yawned. Then she followed him down the steps and into the driveway. He walked by her side, his right hand resting lightly on her back. She turned when he did and the two paced along the highway toward the village—the tiger taking long strides and the boy at times trotting to keep up with her.

They had covered half the way when the boy heard a voice somewhere back of him.

"Don't look around, boy," it said. "Keep straight ahead. You're all right. Don't worry. I'll be right here. I've sent a man around to clear the way. All you've got to do is walk right along. Her name is Minnie."

At the sound of this voice the boy felt the fur beneath his hand stiffen, and the big beast gave a low growl, her tail swinging angrily.

"All right, Minnie, all right," said the boy.

She turned her head and her yellow eyes looked up at him.

"It's all right, Minnie," he soothingly repeated.

She seemed to quiet down at the sound of her name, and the two steadily neared the village. They met nobody, a fact that the boy attributed to the messenger who had gone ahead.

The big tent was set in the outskirts of the town, just at the foot of the hill. As the boy neared it he noticed an animal wagon with its sliding door opened and a slanting runway of heavy boards at its side.

"To the wagon, boy," came the voice from behind him. "Steady. Now say, in, Minnie, in! Say it loudly."

"In, Minnie, in!" cried the boy.

The huge beast seemed to hesitate for a moment. Then she sprang up the runway and into the cage. The sliding doors were closed as if by magic—although the dark man with the big hat seemed to have something to do with it.

For a moment the tiger was quiet. Then she roared and leaped about madly and flung herself fiercely against the bars.

"You don't get away again, old lady," said the dark man.

He laid his hand gently on Tommy's shoulder. Tommy looked up at him. The dark man was wiping his face. He seemed much excited.

"That was fine, laddie," he said. "You're a brave little man." Tommy flushed beneath the stranger's searching gaze. "Come here, Jim," the dark man called and another dark man, a dark man in a jacket with stripes of yellow braid upon it, came towards them. "Who is he like, Jim?"

The man in the braided jacket stared at Tommy.

"He's a good deal like little Joe."

"That's it," said the other man. "That explains it. That's the reason she took to him. She thought he was little Joe." He drew a quick breath and turned to Tommy. "Joe was my boy," he said. "He—he is gone

now." His voice broke a little. "Joe and Minnie were great friends. He could do anything with her. You are very much like him." He turned away abruptly. "Come, my boy," he said, "I'll take you home."

The ride behind the glossy black horse was altogether too short.

"I'd like to see your father," said the dark man when they stopped in front of Tommy's home.

"He isn't home, sir. He and my mother went away. I expect them back before supper time."

"I'm a man of my word," said the stranger. He drew a roll of bills from his pocket. "Here's your hundred, my boy, and I think I'm getting off cheap. Tell your daddy to take care of it for you. And here—here are three seats for the show tonight. Come and bring your folks and I'll see that you don't miss anything. Goodby."

Tommy's father and mother came home before supper time. The old uncle was much better. And Tommy saved his wonderful story until they were all at the supper table.

His chance came when his mother beamed at him affectionately.

"You must have been very hungry Tommy," she said. "I notice that you ate all the cold meat."

"The tiger ate that," said Tommy simply.

"The tiger!"

Then Tommy told them the story. When he had finished there was a little silence.

"The boy's been reading too many fairy stories," muttered Tommy's father.

"I shouldn't have gone away and left him," said Tommy's mother. And there were tears in her eyes.

Tommy stared from his father to his mother. "Don't you believe me," he asked and his face flushed. "Why look here, papa, here's the money the man gave me—and here are the tickets to the show!"

And he spread his treasures on the table.

Tommy's father looked at the money and the tickets and he looked at Tommy and then at Tommy's mother.

"Please can't we go, papa?" the boy timidly asked. "It's a splendid show and the man wants to see you."

Tommy's father looked at Tommy's mother once more. Then he drew long breath.

"Yes, Tommy," he slowly said. "we'll go."—W. R. Rose, in Cleveland Plain Dealer.

FAMINE IN HUMAN HAIR.

The enormous feminine demand for artificial coils and toupees is leading to a famine in human hair. Formerly Swiss, German and Hungarian girls supplied the world of fashionable women with luxurious tresses of all tints. But the governments of many countries are now making illegal for a girl to sell her hair for any agent to buy it. The supply in consequence, is running out and the prices of real hair are trebling. A series of successful experiments says the London Daily Mail, point spun glass as the most effective substitute for human hair. Wigs made from spun glass are light and soft and the texture is soft and beautiful. It is easy to produce any shade desired, while curls and waves can be manufactured at will to suit the fashion of the moment. The imitation is so realistic and true to life that it is impossible to detect the difference between it and real hair grown on the head.

Can't Can Any More

Peaches and Cherries
Plums
And
Strawberries,

Apples and pears by the score;
Logan and blackberries,
I am made of hackberries,
nectarines, quinces, galore.—
Tearful with peeling them,
Frustrated with sealing them,
Dear! I can't can any more!

Apples and Cherries,
Pears
And
Gooseberries,

Squats and guavas to stow;
All there that I want,
Raspberries, pie-plant,
Jellies, and jams in a row.—
I fill with this toiling,
With burning and boiling,
Into the store-house they go!

Orange and Lemon,
Fig
Persimmon,

Onions, and cucumbers hoar;
Slices, cut in slices,
With vinegar, spices,
Sweet pickles, I see a full score;
Butters, and marmalade,
Preserves.—My hand is stayed,—
I surely can't can any more!

—M. E. Dudley.

RECIPES.

Summer Dainties.

Delicious lemon honey for filling
pies or sandwiches may be made as
follows: Scrub clean and grate the
rind of three large lemons. Press
out and strain the juice of the lemons
and put all together in a double boiler
with a quarter cup of butter and
one-half pound sugar. When the
mixture is very hot, mix two spoons
of the well beaten yolks of six
eggs and add this to the whole, stir-
ring until cooked thick.

But strips are as toothsome as
pies are simple to make. Beat two
eggs with half a pound of light
brown sugar and a cup of broken
walnut meats. Sift five level
spoons of flour, with a pinch of
baking powder and a quarter tea-
spoon of salt twice. Stir all to-
gether and bake a light brown in a
moderate oven, cutting in strips
when cold.

quarter pints of double cream and a
cup of grated cocoanut. Flavor with
cherry extract, set the bowl contain-
ing the mixture in a pan of cracked
ice, beat steadily until the cream is
as thick as cake batter, then pour
into small molds. Before serving,
remove part of the jelly from the
center of each mold and fill with
pitted and sweetened cherries, gar-
nishing with sprays of the fruit.

English toast is not so popular as
it should be for a breakfast course.
To prepare it toast as many slices
of bread as needed and keep warm.
Separate as many eggs as there are
slices, keeping the yolks without
breaking. Beat the whites and shape
a cup on each slice of toast, dropping
a yolk into the center. Set the pan
of toast into the oven until the eggs
are cooked, pour melted butter over,
sprinkle with salt and pepper and
serve hot. The toast should, of
course, be buttered. And by the
way, making toast is a science many
cooks have not learned. Most of it
comes under the hardtack class.

HOMELY HINTS.

Rub bread and meat boards with
cut lemons, then rinse thoroughly
with cold water. It is much better
than scrubbing.

If the upper edge of the saucepan
is well buttered you will find that
chocolate, milk, cocoa, or anything
of the kind will not boil over.

Orange peel, dried and grated,
makes an excellent powder that is de-
licious flavoring for cakes or pud-
dings.

Good cooks know the value of a
few drops of glycerin added to the
flour in cakemaking, in the propor-
tion of a teaspoonful to every pound
of flour. This makes the cake light
and feathery. Three teaspoonfuls to
every pound of fruit in making pre-
serves prevents the fermentation of
the sugar and obviates all dangers of
crystallization.

The death dealing frying-pan
should be banished from every kitch-
en. Broiling requires less time and
labor, besides being far more cleanly
as to kitchen and utensils. When
steak is to be broiled have the pan,
which should be a heavy cast one,
when soapstone is not available,
very hot—almost to redness. Have
the steak well trimmed and pounded.
The broiling pan should be three
times as large as the steak and
should be well wiped with a clean
rag. Apply the steak and press it
down with the flat side of a case
knife so as to bring as much of the
surface as possible in contact with
the hot iron. At first it will adhere
to the iron, but will loosen its hold
in about forty seconds, when it
should be turned over and applied
to another part of the pan. After
this it may be turned at will and its
position changed until cooked to
taste. When done put into a dish,
sprinkle with salt and pepper, a very
little vinegar, smear with butter and
eat while hot, for it is too good a
thing to admit of delay. Those who
value health should never eat meat
fried in grease.

My wife and I sat at the window one
day

Stood watching the organ man's
monkey,

When a cart came along in which a
boy

Sat driving a long-eared donkey.
Said I to my wife by the way of a
joke:

"There's your relatives in that
carriage."

She glanced at the donkey and made
reply:

"Ah, yes—we're related by mar-
riage."

Fanning Mills

"The California"

This is one of the most powerful and complete cleaners in the market, and is known as a double blast fan mill. The first blast operates as the grain passes in showers through the sieves, and in this operation the chaff and light stuff is removed. The second blast operates as the grain passes off the last screen in a thin stream and at this time the heavier particles are removed. These mills are arranged to clean beans.

We are also agents for the

Western Fanning Mill

This machine is not only a cleaner but likewise a perfect separator and in this respect will accomplish what no other machine on the market will do. Separates wheat, oats and rye, clover and timothy and makes them marketable in their class. Separates cheat and cockle from wheat. Separates wild oats from wheat, barley and large tame oat. Separates barley from wheat, and rye from wheat. Equipment is five screens and sieves, one-wheat zinc hurdle, a chess-board, tail-board and spout suitable for all requirements of a farmer. Will clean alfalfa seed perfectly. Will clean and grade beans. Alfalfa and bean screens are extra.

Pacific Implement Co.
133-153 Kansas St., San Francisco, Cal.

The Produce Markets

Los Angeles

Markets

LOS ANGELES, Aug. 7.

Butter.

Butter still stands at 65 cents for extra. The receipts are heavy for this time of the year, but it is claimed there will be no immediate change in quotation. Average daily receipts of butter in this city are about 18,000 pounds.

Eggs and Poultry.

Eggs still stand at last week's quotation though the market is weak. The local fresh ranch are held down by the storage which are continually dumped on the market. Speculators who are holding the storage are maintaining the present price in their own interest, but there is little promise of immediate rise.

The prices given are those of the commission man to the retailer.

Eggs local candled.....@28 1/2
Eggs case count.....@26 1/2

Fryers and young roosters have declined a cent a pound. Other quotations on poultry practically the same.

SWEET BUTTER.

If the butter maker desires to keep butter fresh these days, she must take lots of pains with the cream, in the first place. It should be sweet and free from odor. When the churn has been thoroughly cleansed and cooled, turn in the cream and keep the crank going until the butter comes. Then work the butter well and salt only lightly. Make a brine of water to which is added enough salt to hold up an egg. Boil and skim so long as any matter collects on the top. When perfectly cold, wrap the butter rolls in clean cheese cloths and drop in the brine. Set in a cool place and it will keep for a month without becoming rancid. Our mothers used this rule and we know they had sweet butter.

Fresh Fruits.

The fresh fruit market is in fair good condition although sales are rather slow and most of them below average in quantity. The price of watermelons and the other varieties remain firm at the figures given last week. The receipts of peaches are confined mainly to the medium grades stock and therefore, the price has not quite as wide a range as former. Pears are on the decline in price as receipts are larger than the demand.

Citrus Market

S ANGELES, Aug. 7, 1907.—“The July for Valencias I have ever seen,” remarked R. H. Wilkinson, agent of the California Fruit Exchange to the writer today. Mr. Wilkinson also remarked on the excellent condition which has prevailed in the market all the season, also on the promise for satisfactory conditions for the coming season. “Especially,” said Mr. Wilkinson, “for the finer grades of well packed fruit.” “It is astonishing how the trade will pay prices for a handsome pack of fruit, while an indifferent pack is begging.” The trade each year demands a little higher standard which the grower and dealer must recognize, if best returns are desired. The extra cost of more careful handling is slight. Boxes, light and selling expense are no more than additional return practically goes to the grower. Let next year’s be the finest ever out of the State. There are approximately 500 cars of Valencias yet to be shipped and about six months in which to ship it. All cars are gone, though by the follow-up sales report even navels are in the hands of the Eastern auctions. Those doubtless storage fruit kept on ice will arrive in Eastern markets. The sample sales below show that Valencias are commanding top notch prices. Lemons are hardly as good as last year. More foreigners are being received this year may account for it, but the grower is not discouraged for returns are the rule.

Shipments.
Shipments of citrus fruits to date are 9 cars of which 3043 were lemons. Same date last season, 24,603 of which 3241 were lemons.

NEW YORK, Aug. 5.—The Valencia market is unchanged. Weather cloudy. No cars sold.

BEE STING CURE FOR RHEUMATISM.

Bee-sting is said to be good for rheumatism, but that is not the bee’s intention in administering it. The bee has other problems than those connected with the curative art. His intention is to lift his man out of position and he does it—unless the latter is intoxicated. If the man has rheumatism, no matter. The bee moves him at once by eliminating acid from the blood and arousing the gamiest leg from the lethargy of ages. It is well before annoying the bees to get your rheumatism established, because one bee-sting will lap over a good deal of rheumatism and if you have an insufficient supply of the latter to neutralize it, the bee, in his earnestness, is prone to overdo his part.—Minneapolis Journal.

A handful of salt or a piece of zinc, thrown into the stove occasionally where there is a good fire, helps to keep flies clear.

THE HARVEST THAT NEVER ENDS.

Dairy farming, which has been happily designated, “the harvest that lasts all the year,” enters into the field of manufacturing more than any other farming pursuit, since the dairy farmer furnishes both the raw material and finished product. It enters both into live stock raising and general farming and for the greatest success demands that those who follow it shall have a thorough as well as practical knowledge of the breeding and raising of animals, no less than the planting, cultivating, and harvesting of farm crops.

Whole nations, as Denmark and Holland, and whole States, as New York and Wisconsin, have been made prosperous by attention to dairy farming and the production of butter, cheese and milk of high quality. Many farmers have become wealthy in land and money by the pursuit of dairying. Whole communities have been built up and enriched by the gentle dairy cow and the man behind her. Dairy farming, also, has this important advantage in that it restores fertility to the land, while other systems of cropping take fertility from it as each load of grain or grass is hauled away to be sold.

Looking at the less attractive side of dairy farming, it is often urged that those who follow it are compelled to be in their place every day in the year without a vacation or holiday. This is true in many cases, for the cows must be milked each day, and the milk disposed of. Very often this requires the personal attention of the farmer, especially where the help is not the most reliable. But is it not true that the successful man in most all other vocations must attend to his calling with regularity? And oftentimes the other man’s daily task is less independent, less remunerative, and more exacting.

There are, of course, hardships connected with dairy farming and the handling of cows, and often the shipping of the milk or cream, and the profitable marketing of the same are attended with difficulty, but were this not the case it would be different from most other pursuits of life, and would attract many from them.

With the strict regulations which are being put in force by State, county and city health authorities, calling for more attention to cleanliness of milk production and the health of the dairy herd, dairy farming and pure milk becomes of greater importance, and for a higher grade product the milk producer is justified in expecting a higher price.—[Inland Farmer.

NOTES OF THE HOG LOT.

Build the fence around the hog lot so the pigs cannot wriggle through. Once they learn the trick nothing short of a bull-proof fence can stop them.

If we are going in for hog raising let us plan our campaign in advance and then stick to our work. A haphazard, go-as-you-please method is sure to end in failure.

A pig rises up today only to be cut down tomorrow. He is with us but a short time but during that period he is either making or losing money fast. It all depends upon his owner.

A chicken-eating sow is abomination and is not worth her keep un-

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits...See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

less she can be confined in a hen-tight enclosure.

Give the hogs shade and plenty of air with it. A tight, dark pen is a poor place for hogs in hot weather.

While a hog will drink dirty water, clean water will make better pork.

If a pig is allowed to wallow in a barnyard pool he will never get over the habit but will always return to it.

Hogs must live on the ground to thrive—particularly in summer time.

No matter at what season the sows are due to farrow, care should be taken to provide for them with dry, clean quarters to themselves.

As a rule, after a sow farrows, she should not be disturbed in any way until she gets up of her own accord, when she may be given a bucket of good slop.

An abundance of milk for the first eight or ten weeks of the young pig’s existence is the best preparation they can have to fit them for profitable growth afterward.

There is no better feed for young pigs after they have learned to eat than good oats. It can be ground and made into a slop with sweet skim milk, all the better.

The cheapest growth with growing pigs is secured by giving them the run of a good alfalfa pasture and feeding them on a slop of middling and skim milk, or bran, oil meal and skim milk.

INCREASING BUSINESS.

The Tallerday Manufacturing Co. has been pushed by increasing business until improvements, and enlargements have been made at its factory at Dolgeville, making possible greater and greater output.

Now the office force has had to be enlarged, which has bene done by adding new blood entirely. The management send out the following:

“We beg to announce that Mr. C. B. Johnson has acquired the interest of Mr. F. G. Tallerday in this business. The officers of this company are: C. B. Johnson, President; H. G. Tallerady, Vice-President; W. P. Finnerty, Secretary and S. W. Hudson, Treasurer. Offices at 636-637 Pacific Electric Bldg., Los Angeles. Factory, Dolgeville, California.”

The goods, pipe, tanks, etc., sent out by tis large concern have won favor and friends. May it continue to send out labor-saving and water-saving appliances.

GET THE ORIGINAL.

The cheap reprint—“Original Reprint”—of Webster’s dictionaries often offered as premiums or for sale at bargain counter bookstores, has proved a great disappointment to many. It looks a little like a Webster, and is, indeed, a reprint of the old and out of date issue of 1847, the copyright of which, long since expired.

Readers of the Cultivator who wish the more recent publications which give information in keeping with the times should watch well to get the genuine G & C Merriam publication—get Webster’s International dictionary. The publishers say of it that it was produced at an expense of a third of a million of dollars. Also that, “now at the beginning of the twentieth century we have issued a new and enlarged edition of Webster’s International dictionary, containing 25,000 new words, with new plates throughout, and edited by W. T. Harris, Ph. D., LL. D., United States Commissioner of Education.”

A prospectus will be sent to Cultivator readers on application to G & C Merriam, Springfield, Massachusetts.

He who is always hearing and answering the call of life to be thoughtful and brave and self-sacrificing—he alone can safely hear the other cry of life, tempting him to be happy and enjoy.

San Francisco

One of Fresno County's Productions

Fresno county is synonymous with "Raisin" and "Grape." It is a county of all kinds of fruits, but "Raisindom" more nearly expresses it. Neither is it any small patch on the map, for it has an area of 6152 square miles, a liberal portion of which will grow grapes, as indicated in above engraving.

Those grapes were grown in Kerman, one of the newer subdivisions, about which a writer recently said, after he had passed by it:

"A few farmers have told about it in language that appeals to farmers. This is the language of thriving vineyards and peach orchards. They tell their own story."

And as to its town he said:

"Kerman is a model city with everything but people. It reminds one of a perspective map of a town. It is the Burnham plan on a small scale. It is not a Topsy town. When it becomes a city, which ought to be in the near future, it will not have "just grown." It is carefully laid out in advance. It is an instance of special creation, as opposed to natural evolution. Boulevards, parks, drives, sidewalks, those things that people begin to think of after a city has grown up without them and has become close and stuffy, are all provided for in advance."

Coulson's Improved Mash Egg Food

**Takes
Less
Feed**

**Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

—2 to 60 Horse Power—

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropico, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,
By E. B. Barry, Manager.

A Florida Green House System

How the Production of Fancy Fruits and Vegetables is Carried On in Florida Without the Expensive Glass House System

FLORIDA has learned by experience a lesson of value as to frost protection. California has likewise had some occasion to think of that line, though she has never had as severe a lesson as has Florida. But frost protection is a live question here. At one time one entire acre, 20 acres, we believe, at Riverside, was covered at great expense with a lath house. This experiment was never followed and has proved to be, as the house or covering of lath has now been taken away, so we assume it is considered a failure, as a means of protection for orange groves at least. But along the line

growing vegetables or other valuable crops the growing, which we take from the Florida Agriculturist, which paper extends the courtesy of the accompanying cuts, have hints of value for California growers.

Here is the Florida

Our readers are more familiar with the glass greenhouse systems in and around the big cities, by means of which fine vegetables are raised and sold during the winter at extremely high prices. Comparatively few, however, have knowledge of a system that has been origi-

ated and put into use here in Florida, during the past few years, in which cotton cloth is substituted for glass, and the place of the elaborate and expensive heating devices used in the north-glass greenhouses is taken by simpler and less expensive, though quite as efficient method of heating, considering that nine-tenths of the time we have the natural warmth and sunshine of Florida to induce growth.

Our representative has lately visited several of these cloth greenhouses and we herewith reproduce photographs showing the new form of construction and various crops raised by means of it.

Advantage over Glass.

The principal advantages of cloth curtains of top and sides over all the glass greenhouses are, first, the absolutely natural conditions that surround the plants during their entire period of growth, uninterrupted sunshine, air, rain and dew. The cloth curtains of top and sides are all rolled back and never cover or shade the plants during the hours needed for protection against frosts or freezes; second, the immunity from fungus diseases and other pests that exist under the glass greenhouse system; and last, not least, the great saving in cost of construction and maintenance. A well equipped glass greenhouse costs from ten thousand to fifteen thousand dollars per acre, whereas the cloth greenhouse costs in the neighborhood of one thousand dollars per acre. From two to four crops per year are grown under this system on the same ground.

Mr. C. M. Berry, of Orlando, has the management of several of these properties, and the information, figures and photographs furnished by

him, in conjunction with the result of the investigation of our representative are here given. Mr. Berry has at the present time eggplants, peppers, tomatoes, cucumbers, beans and strawberries in bearing. Everything carried safely through the late "freeze" when the temperature was as low as 24 degrees at Orlando. Besides these there is a fine budded grapefruit grove now four years old (and beginning to bear fruit) that has been produced under this system, fine vegetables and berries having been grown between the rows of trees for the past four years. At least one more crop of vegetables will be pro-

A portion of a 17-foot cloth greenhouse at Orlando, Florida, showing young grapefruit grove with vegetables growing between the rows of trees. (The plants on the outside were frozen during the December, 1906, freeze, while everything inside was carried safely through.)

duced on this ground and then the cloth greenhouse will be devoted entirely to the grapefruit trees, insuring them from being frozen, protecting each year's bloom from damage, and enabling the grower to hold the fruit on the trees without danger from freeze throughout the winter until such a time as the extremely high prices that prevail after the general crop of out-of-door grown grapefruit is gone, justifies the marketing of the protected fruit.

Heating.

The usual height of the cloth greenhouse for the growing of vegetables alone is seven feet—admitting of horse-cultivation—but one for grapefruit or other trees, as in the above instance, is from seventeen to twenty feet in height. In case of cold weather it takes two men one hour to close this cloth greenhouse of one acre, as the construction is conveniently arranged and planned so that large acreages may be practically handled. Brick furnaces with sheet-iron tops and long stove pipes conducting all of the smoke and gases outside, are distributed at the rate of twelve to the acre. The fuel used is wood, and no more than eight of these furnaces have been lighted at one time in order to raise the temperature sufficiently to overcome any freeze that has visited Florida within the past ten years, though more can be readily added if found needed. The cloth is chemically treated, and some of it now in use has been used for the past nine years, though not on the present form of framework, as that has been adopted during the past four years.

Have Been Successful.

The success of the growers using this system of cloth greenhouses proves its value and assures its future adoption by growers of fine fruits and vegetables, as one good crop saved from freeze will pay for the greenhouse.

"The refrigerating of cars of fruits and vegetables shipped to our northern markets now insures their arrival in first-class condition and, considering the great difference in cost of production, the products from our cloth greenhouses are destined to compete successfully with the glass greenhouse products of the North."

The first man to introduce canning into the United States was an Englishman named Thomas Kensett, who learned the business in the old country from Peter Durant, who in 1810 obtained a patent for putting up food in hermetically sealed vessels of glass, pottery or tin. In 1825 Kensett established a factory in Maryland. It did not make much progress until the Civil war, when there was a great demand for vegetables and fruits in the army.

CARE IN DRYING PRUNES.

A GROWER and dryer of prunes at San Jose, J. Luther Bowers, thus writes the Mercury:

No time during our now extensive prune industry should such care be taken in drying or curing prunes as the present season. Orchards and productions of dryers have been bought on the four, four and one-half, five and five and one-eight-cent basis, and at this high price of prunes, a tendency will be created to put in everything that contains a pit, regardless of quality. If every grower who dries his prunes and every person who buys the growers prunes to dry would aim to make his dried prunes of the very best quality, the California prune producer has it in his power always hereafter to maintain our prune price at a three-cent basis or over, regardless of crop conditions.

The first picking should be all picked up clean and dried and kept by themselves. Most of the very first prunes to ripen will be either sunburned on one side or have a split pit. Such fruit should never be put in with the bulk of the dried product, as a few prunes of a poor quality will often ruin the sale of the entire lot, should the purchaser get hold of a faulty prune as a sample. By all means keep this first picking by themselves and sell them for whatever they are worth.

Gathering the Fruit.

Prunes to make the finest quality of dried fruit must be fully ripe and allowed to fall from the trees. Even a ripe prune taken from the tree before it has loosened from the stem does not contain the sugar like a prune that has ripened and fallen off of its own accord, and for this reason at least the greater portion of the prunes should be left to fall without shaking the trees.

The crop being light this year,

many growers will try to save expense in dipping and will pick two or three days before dipping. This should be avoided if possible. During my long experience in handling prunes I find that it does not pay to even keep prunes in boxes over night for the reason that they go through a sweat, and whenever they do go through a sweat they can never make a first quality of dried fruit and for every night a prune remains in a box it will take two days longer for the prunes to dry for the first night and the time will double for each succeeding day. For instance, should a lot of prunes be left in the boxes for four days and a similar lot be picked fresh from the ground and both be dipped at the same time, the day the last lot were picked up, those in the boxes four days would be from 20 to 30 days longer in drying and nothing less than an evaporator will dry them sooner.

I would rather let the prunes lie on the ground under the tree for a week or ten days than to let the picked prunes lay in the boxes over one night.

Grading Beforehand.

Many growers still cling to the idea that prunes must be graded before they go on the trays. I have never seen where anything was gained by this work. By not grading the green prunes a lot of hard work is saved, and when prunes have laid on the ground for four or five days a lot of them are soft; these will often hang in the meshes of the screens and break and muss up a lot of other prunes and when dry will stick to the trays, making many slabs of faulty prunes, while if they are not green when graded, the large prunes will dry just as soon as the small ones; none will stick to the trays and when the dry fruit is thrown on the pile all now go through a sweat and all are of the same moisture. Certainly I for one would never think of green grading for perfect fruit.

At Boiling Point.

The dipping vat should be in such shape that the dipping fluid can be kept at the boiling point and no prunes should ever be put into this fluid unless it is boiling. It is not a matter of how strong the lye is, but, how hot is the water. In drying prunes just two things will happen; they will either dry or ferment. The fermenting germs are in the inner skin and unless the water is hot enough to kill these fermenting germs, the prune will not immediately commence to dry, but will, in a few days, become a chocolate color and refuse to dry, sometimes a few on a tray, often half and sometimes nearly all. The cause of these conditions is, that the prunes have not been in water that was boiling, if dipped the same day that they were picked.

If the water is at the boiling point all through the dip, two pounds of lye to the 100 gallons of water will be sufficient; if the water is not boiling ten pounds of lye to the 100 gallons of water will be enough.

Only weather conditions govern the time prunes should remain on the tray. Grasp a handful of prunes and give them a gentle squeeze and open the hand quickly, if the prunes separate they are ready to stack and should be placed in the bin before they rattle on the tray.

SULPHURING FRUIT.

Recently there has been considerable disturbance in the fruit world because of the action taken at Washington in relation to the pure food law and the report that the construction of the act has been interpreted in such a way that California sulphured fruit will come under the ban, unless the sulphur is used in quantities as prescribed by the following as stated from Washington on Saturday last:

"Sulphur fumes may be used pending further investigation, but in reduced quantities, 350 milligrams per litre in wines and 350 milligrams per kilogram in other food products, which not over 70 milligrams is in free state."

"Upon the statement of California that this amount is not sufficient, the department has agreed to investigate further and to send men to California to demonstrate that the allowance is sufficient."

Sulphur is used in California fruit processing to protect the dried fruit from moths and worms. As every California producer eats the fruit in which sulphur is applied, he certainly exemplifies the proposition that "the proof of the pudding is in the eating thereof." Sulphured fruits do not injure California people, hence why is this excitement in the East? Who is stirring this thing up? Is it some interests who are other than producers of fruits that are raising this question to stall the operations of the pure food and drug laws?

We confess that we do not know but any information as to who of what influence is at work would help to solve this matter. The order that when sulphur is used, that fact must appear on the label is all right. It ought to be done. All food products of any country should be branded just as they are. This matter was fought out when the oleomargarine act was passed and it was settled that as to the imitations of butter the butter and the imitations should be branded to show what each product represents. It was all right. Sulphured fruits are all right when people know how to use the goods, that is, to soak the product in water in which a little soda has been added, the whole effect of the preservative—the sulphur is vitiated and a perfectly clean and wholesome food is ready for consumption. The recent order has made a whole lot of trouble, and the government ought to see to it that prompt work is done and thus save growers and the packers and buyers a whole lot of trouble. For inquiry here in Hanford, today among some buyers of dried fruit satisfies the Sentinel that with the order standing as it does, many producers will be up against a hard proposition, and so, too, will the buyers as some of them declare they cannot make advances on contract, and in some cases the buyers have advised to let the early peaches rot on the amount to we cannot say.—Hanford Sentinel.

BARTLETT BLOSSOM WILL FERTILIZE ITSELF.

We are in receipt of the following from John Vallance, Supt. of the nursery department of the Cox Bee Co. of San Francisco.

I notice in your issue of July 11 page 52, a statement (copied, however, from Field and Farm) that the Bartlett pear will not fertilize itself. This is erroneous, as I know an orchard at Livermore, planted to Bartlett's only, that has annual crops, and there is not another pear tree nearer than two miles to said orchard.

IRRIGATION.

Wherever practicable all deciduous fruit should be irrigated as soon after fruit is picked as possible. While fruit is ripening water need not be applied unless the ground gets dry and the tree shows signs of needing water, which can always be known by the appearance of the leaves. However, all trees that mature their fruit in July or early in August in an ordinary rainy season will get along with one irrigation previous to picking their fruit. Thorough cultivation should always follow irrigation and in most cases two good irrigations will put the deciduous trees through the growing season, but it is to remember that the fall growth that makes the fruit buds for the following year and any extra attention this time is amply repaid during the following year.

Although much fruit of good quality is grown without irrigation, the consensus of opinion is that irrigation is well, both in increased size of fruit and in quantity of fruit. All down the coast, in reach of the moisture from the ocean, is a belt of land that is remarkably well without irrigation, and even when the rainfall is scanty, thorough cultivation will produce good crops of fruit. But a closer observation shows that irrigation produces much larger trees in the same time and much denser foliage at all times, which is a very great benefit, in case of a few exceptionally hot days with drying winds, and places where sunscald is indicated. It applies also to walnuts and might have prevented some of the sunscald.

PEACH DRYING.

Peach drying heads the list during August and, in case of some late varieties, it will run over into September, but it must always be remembered that for drying fruit one week in the middle of August is worth three after the middle of September. Clingstones are at their best during this month, and as a rule are preferred for canning. By the use of improved knives they can be cut for drying or canning very rapidly. For home use clingstones are preferable, but by ordinary methods of cooking for filling bottles and cans, they keep their shape much better and do not become soft or mushy during cooking. A pit left in the fruit is an improvement in flavor. This applies to stone fruits, apricots and plums especially. In putting up clings for home use, try a few bottles with the pit on. They retain much more of the flavor in this way. If they are washed and wiped with a dry cloth the fuzz will be removed. Yellow varieties of peaches are preferred as being more pleasing to the eye, suggesting some flavor.

PRUNING APRICOTS.

Where it has not been done sooner, it would be well to prune apricots, especially young trees, and it should be done as soon after a good irrigation as possible, in order that the full force of the new growth and flow of sap may be forced into forming fruit buds for the coming year. Where large growths have been made of from two to three feet, it is well to cut them back, say one-half at least, and this summer pruning will, if well done, remove the necessity of winter pruning. It must be noted by those who have not had experience in our California methods, that as a rule summer pruning is injurious and should never be done except to pinch the tips of branches that are like-

ly to make such a growth as to bend them down. Pinching the tips of the branches compels a stock growth, but regular pruning with the vigorous growth of the apricot acts as a former of fruit buds. Where pruning of the apricot has not been attended to, the orchardist will sometimes find the weight of fruit on his trees breaks them down completely, when if they are not broken below the bud the only way to do is to let them start and grow and form a new head, provided it does not kill the tree altogether.

APPLES AND PEARS.

Apples and pears must be gathered before becoming dead ripe, as they will be much finer flavored in this way. Ripeness can be told by the seeds turning black. Pears for canning or drying must be kept until they get mellow, when the fruit is in its perfection.

If they have to be shipped they must be shipped while yet firm and solid, and if intended for market they must not be too soft, or they will get bruised before being sold.

ROOT REGULATIONS.

An Eastern exchange has a suggestion which may be of value, but we think but few gardeners will have the patience to give it much of a trial. Here it is:

Regulating the root growth by root pruning, transplanting and other methods is no new idea. The several transplantings, often practiced, are, however, sometimes difficult, as when a tap-root runs deep into the earth. A Texas man has, it appears, invented a mechanical device to regulate root growth. His idea is to insert a metallic openwork strip or screen in the earth and plant over it. The main root of the plant striving to pass through the screen in its downward journey is partially headed off and forced to throw outside roots.

Many of the trees and shrubs throw out suckers during the early summer. They are now making a heavy growth and taking a great deal of the sap needed to develop fruit. By cutting them off now much of the sap needed elsewhere by the trees will be saved.

NATIONAL NUT GROWERS.

This is a great country with great diversity of soil and climate, but each section has one or more species of nut trees adapted to the local conditions.

Since the organization of the National Nut Growers' Association in 1901, a rapid development in the nut industry has taken place in Southern territory, where the pecan finds its most congenial surroundings.

The sixth annual convention of the National Nut Growers' Association will be held at the Jamestown Exposition, September 26-28. This meeting follows that of the American Pomological Society, which closes on the morning of the 26.

If you have an orchard or vineyard you must learn how to recognize the San Jose scale, the codling worm, the curculio, American blight, vine hopper, mildew and black-rot. Do not console yourself with the reflection that these are not injuring your orchard. If you wait until the pests commence to show signs of injuring, it will be too late to extirpate them!

Implements for the Ranch

We can supply **everything** that is needed in Ranch Implements. If you need a wagon we have the Shuttler—the "king" of all wagons. We also have the Burg, the Harrison, and the Winona Wagons—all good.

If you want a Fertilizer Drill, we can supply you with the BUCKEYE, built especially to meet California conditions—and it does it. No better drill is made—we have never seen one as good.

We have the Great Western Endless Apron Manure Spreaders. Every ranch should have one—saves time—saves money—increases crops.

We are the largest implement and vehicle house in Southern California and we maintain our supremacy by square dealing, reasonable prices, and absolutely reliable goods.

We want to see you at our store.

**The Cream of
Cream Separators**

The Sharples Dairy Tubular is the
cream of cream separators—the pick
of the whole bunch. Supply can wait
low, you can fill it with one hand. All
gears enclosed, dirt free, absolutely
self-oiling—no oil holes, no bother—
needs only a spoonful of oil once or
twice a week—uses same oil over and
over. Has twice the skimming force
of any other separator—skims twice as
clean. Holds world's record for clean
skimming.

Bowl so simple you can wash it in 3
minutes—much lighter than others—
easier handled. Bowl hung from a
single frictionless ball bearing—runs
so light you can sit while turning.
Only one Tubular—the Sharples. It's
modern. Others are old style. Every
exclusive Tubular feature an advan-
tage to you, and fully patented. Every
Tubular thoroughly tested in factory
and sold under unlimited guaranty.
Write immediately for catalog J-260
and ask for free copy of our valuable
book, "Business Dairying."

Live Stock and Dairy**THE LAST OF THE SILOS.**

WHEN I began to write about
silos over a month ago, I
thought of two papers, but it
has lengthened into five; I truly
think this will be the last at present,
yet the subject is far from being ex-
hausted. Yet I may after all find I
am like the two men that disputed
over a promise. The first man said,
"Sir, you have broken your prom-
ise!" "The other man replied, "O!
ne'er mind that, I can make you one
fully as good right away."

Concrete Silos.

Good cement is requisite to give
strength, if the mass is to be perfect.
Good cement and a knowledge to se-
lect the right sort of sand to use. In
California along the Sierras, the
rivers and washes carry down disin-
tegrated granite as sand. This has a
sharp edge and makes an admirable
concrete. The secret in making a
lasting wall of cement is never to let
it dry until completed; if it dry out
between the different days' work it
will always be less resistant in that
spot. Where it is kept wet it will
form a true monolithic wall. The
disaster in San Francisco clearly
shows that weak points in the con-
crete came on the Sunday laying off.

The great strength of cement and
stone work was clearly brought out
in that massive wall of the Empor-
ium building that stood reaching sky-
ward, straight and sheer without
side wall attachments; it had stood
earthquake, fire and dynamite. The
continuous wall for the silo is made
by using an adjustable frame that
moves upward as the walls are built.
The plan of this sectional frame can
easily be obtained. The concrete
wall can be made heavy enough to
stand the pressure, but it is cheaper
to make it lighter and reinforce it
with heavy wire or light iron rods.

Cement Blocks.

A form of hollow cement block
has been perfected for silo building;
at present it is too soon to pronounce
it good, though it seems to be all
right. The blocks are made with an
interlocking end and have a curve to
follow the outline of the silo. Bands
of iron are embedded between them
in the mortar to add strength. An-
other form of blocks have a small
depression near the outer wall, or
rather at the outer edge; into this
a round half-inch of iron is embed-
ded. This is used on every third
tier of blocks at the lower half of the
silo and on every fourth round on
the upper part. This form is not as
strong as the reinforced concrete
wall but it is much cheaper to build
as the blocks are moulded on the
ground.

The expense of a cement silo is in-
creased by lack of skillful laborers,
and by a lack of understanding of
how much sand and cement to use.
Usually a wall ten or twelve inches
thick is used when, if the reinforced
concrete was perfectly made, a wall
four inches for the first half and two
inches for the upper half would be
sufficient. The inside and outside of
the concrete silo received a coat of
sand and cement equal parts of
each made thin enough to apply with
a whitewash brush.

Buff Jersey Silo.

The modifications of the silo are

See us for Sanitary Milk Bottles... O. J.
Weber Co., 555-557 S. Los Angeles street,
Los Angeles.

many and the working plans can be
purchased of the inventors for a
small fee. The Buff Jersey was de-
signed by E. W. Cobb of Illinois, a
well-known lecturer and writer on
dairy topics. The chief merit of this
silo is its cheapness, as it cost, but
little more than a stave silo and is
more durable. It cannot fall down
even if it does shrink up when empty.
The staves are two by fours; these
are matched but not beveled, the
sides and inner surface receives a
heavy coat of gas tar before they are
set up. Every 36th or 48th stave, de-
pending on the diameter of silo, a
larger stave made of a four by six
is put into place. The four-inch face
of this larger stave is put into place
flush with the inside and it projects
on the outside four inches. The
staves are nailed together with six-
inch spikes every three or four feet
all around. The large four by six
staves are bored with holes for the
round iron rods to pass through.
These hoops have the regular take-up
lags on them to tighten up the silo
with when it is empty. The hoops
are placed three feet apart on the
lower half of the silo and four feet
apart on the upper half. The Gurler
silo described last week is a little
cheaper than the Buff Jersey.

Minneapolis Silo.

This is patented, but its principle
can be readily described; it is a silo
easily set up and can be readily
shipped in the knockdown. The dis-
tinctive feature is that the studding are
four by fours with a groove on the
side. The studs are set up two
feet apart and the spaces between
are filled by slipping a panel made of
six-inch planking with a beveled
edge into the grooves, no nails or
spikes are used. The whole struc-
ture is bound together with an iron
or steel hoop drawn around the out-
side over the studding. The advan-
tages are that the silo is easily re-
paired by merely replacing a portion
of the work. The fault it seems to

Phones: Sunset, Broadway 5006; Home 2627

is in the short panels shrink-
and admitting air, so that the
tops must be kept tight all the time.
The number of joints to keep tight
them to make it almost an impossi-
ble task after the silo grows old.
The matter of building for ease of re-
pair reminds me of the women that
use a machine for their sewing that
will rip easily, never considering
how much better it is to have fewer
seams and wear out their clothes
than to constantly remake them.

Christensen Brick Silo.

This is a brick silo reinforced with
a peculiar steel band. The band is
three inches wide and one-tenth of
an inch thick. The one edge of this
band is run through a crimping ma-
chine that throws it into a circle.
At the end the band turns upward
four inches leaving a two-foot space
between the two ends; iron bolts
tag enough to reach across the
four spaces complete the iron hoops.
The brick wall is constructed as fol-
lows: The outer wall has the brick
laid flat making a four-inch wall;
the inner wall the bricks are on
their edges making a two-inch wall.
Between the outer wall, every ninth row of
bricks is laid endways as a binder
between the walls; this is further
strengthened by having the crimped
steel band laid on it. The inner
wall ties to the outer wall by putting
a brick lengthways between every
other brick; in the third row be-
tween each steel band. The bricks
are set with cement mortar; the
floor is continuous and is made of
heavy planking. The Christensen
silos are adapted to very cold cli-
mates and are often built with two
zigzag flues in the walls connecting
with two fire places where fires are
kept burning when the thermometer
drops below zero.

Warning!

Do not try to build a silo too
cheaply. It lasts a long time and
could be made durable as possible.
It must be air tight at sides and bot-
tom to make good silage. It will
pay well to read up before deciding
on the best form for the dairy farm.
There are a number of good books

Cream Separators, all sizes, all prices.
O. J. Weber Co., 555-557 S. Los Angeles
Street, Los Angeles.

written on silos as well as the cir-
culars of the different patentees. The
silage cutters also have good litera-
ture to distribute on the subject.
The Government Bulletin by C. S.
Plumb; Farmers' Bulletin No. 32 is
also good. The cost is too great for
mere guess work; if you try to guess
about it you may be as badly left as
the man that stopped his horse and
called loudly to a man walking along
the road, "Hello, Pat, which is the
road to Burlington?" "Sure and how
did you know me name was Pat?"
"O, I guessed it." "Thin, be jabber,
since ye'er so good at guessing, ye'd
better guess the way to Burlington,"
said Pat as he walked away.

SONOMA PROSPECTS.

Writing from Sonoma county, a
subscriber says, the season has been
a prosperous one on the whole, for
the dairyman. Good prices have been
received for butter fat. Cows have
done well and hay, while not a big
crop, is yet sufficient to permit a
good many farmers selling from 20
to 40 tons. The dairy season, on the
whole, may be set down as fairly
prosperous.

COMMON AILMENTS OF PIGS.

I find constipation, scours and
thumps the most common ailments
that I have to contend with in early
pigs; have had very little thumps
for several years, but my pigs are
very apt to be constipated for a
while at first, then run into scours
(although my sows are never consti-
pated.) If pigs are too young to eat,
I feed sows tallow, cracklings or
something of that kind. If the pigs
will eat, I take the tallow with
cracklings in it and shave it down
thin on the floor for them to eat, and
it soon loosens them up. For scours
I stop feeding the raw corn and slop
and give them ground rye, dry. I
feed it on the floor, so the pigs can
eat it, too, and they come all right
in a day or two. I think thumps are
caused by constipation and indiges-

geles St., Los Angeles.

tion. I give tallow as above, and
get them out on the ground to exer-
cise as soon as I can, if it is only
an hour at noon. If the thumping
or heaving is caused by cold and in-
flammation of the lungs, a little pine
tar put back of the tongue will some-
times give relief.—A.

MOLASSES FOR STOCK.

In the record of experiments in
fattening stock on molasses at the
Texas Experiment Station the con-
clusions which were drawn regard-
ing the feeding of molasses were in
effect as follows: In the tests re-
ported the addition of molasses to
a fattening ration for cattle always
produced an increased gain and add-
ing molasses to a ration of cotton-
seed meal and hulls diminished the
cost of gain. When molasses was
added to a balanced ration, though
the cost was not decreased, larger
gains were noted and the appearance
of the cattle was improved. No un-
desirable results were noted when
yearling steers were fed a gallon of
molasses per head per day, and
there is good reason to believe that
larger amounts might be used. Mo-
lasses returned from 3 to 30 cts. per
gallon, the lower value being ob-
tained when it was added to a well-
balanced ration and the higher value
when it was added to a ration which
in the early part of the feeding period
was not well balanced.

THINGS A DAIRYMAN SHOULD KNOW.

Every dairyman should know—
The cost of producing a gallon of
milk.
The cost of producing a pound of
butter fat.
The cost of feeding a cow one year.
The cost of labor in caring for one
cow one year.
The number of pounds of milk
each cow in the herd yields each
year.
The number of dollars each cow's
milk brings each year.
Which is the most profitable cow in
the herd, and why.
Which is the poorest cow in the
herd, and why.
How many boarders there are in
the herd.
How much feed each cow will con-
sume during the feeding period.
Which is the best and cheapest
feed.—[Hoosier in Jersey Bulletin.

The Ornamental Garden

THE ROSE GARDEN.

A GREAT variety of soils can be successfully used for the growing of roses but a moderately heavy loam from a well-rotted sod is perhaps, the most favorable. If the right type of soil cannot be found, light and heavy soils can be mixed to secure a soil of the desired texture. If it is desired to secure a soil for a forcing house or for potting purposes the sod should be thoroughly rotted and have incorporated with it about one-sixth to one-eighth of its weight of thoroughly rotted stable manure. Assuming that the proper loam can be found for rose growing, the sod may be cut in the fall and composted with manure, using about one part manure to three parts soil. During the composting period this pile should be turned and mixed several times previous to use, getting it into good even condition. For the production of good roses the matter of feeding the plant is of great importance. What to feed, when to feed, and how to feed are questions often asked and for their answer one has to depend largely upon the experience of expert growers and experimenters. While there is a great deal yet to be learned by careful experiment, yet a statement of general practice for the feeding of such plants is of much value. To the mixed material indicated above there should be added a short time before the planting of the rose, fine ground steamed bone to serve as a source of phosphoric acid and about 1 pound muriate of potash to a cubic yard of soil should also be used. It is well to remember that the compost for starting the new plants should not be too rich to start with or the roots of the young plants will be injured. In the production of this class of plants there is much greater damage of over-feeding with nitrogen, than underfeeding, still one must be careful and not go to the other extreme, for if one would have large, healthy well formed flowers, there must be an abundance of easily available plant food in the soil. It is more desirable in feeding roses and similar crops to rely upon barnyard manures, supplemented with bone and potash than to attempt to give all of the plant food through the medium of commercial fertilizers, still success can be had even through the latter medium alone.

If the vegetative growth needs stimulating and brightening, and the plants have strong root systems, a liberal feeding of nitrate of soda, say ten ounces to 50 gallons of water per 100 square feet of area may serve a purpose. If the growth is active and of good color, but rather spindling and short, there is evidence of the need of potash, in which case nitrogen should be avoided. Potash may be supplied by giving an application of sulfate of potash used at the rate of 8 to 12 ounces to 50 gallons of water per 100 square feet at intervals of ten days to two weeks, or, the undissolved sulfate of potash may be sprinkled at the same rate per 100 square feet. This application should be followed for the second and third application, by lime at the rate of one pound to 20 square feet. If the plants are growing well, but are not making flower buds, they should be given liberal application of phosphoric acid in the shape of steamed fine bone or if it is desired to avoid the nitrogen entirely supply superphosphate at the rate of one pound to 100 square feet, followed in a short time by an application of lime as in the case of potash.

If there is reason to believe that a complete plant food is necessary to promote the growth of the plants the following combination of material is recommended: one fourth lb. nitrate of soda, one pound acid phosphate, 1-2 pound sulphate of potash for 150 square feet of area. The following formula is recommended by Professor Stewart of Indiana and is a complete fertilizer for roses.

Superphosphate, 130 pounds, sulphate of ammonia 13 pounds, nitrate of soda 31 pounds, sulphate of potash 26 pounds.

He recommends one ounce of this mixture to one gallon of water for two square yards of bench surface, once a week as the plants need it. One who pays close attention to the food requirements of their plants as well as to the physical condition of the soil will have much better success than from the general haphazard method so often practiced.—Geo. Wright.

ALASKA'S FLOWERS.

People who have never visited the Territory of Alaska and are not familiar with its resources and conditions generally, naturally are a little incredulous when we speak of the soil, the botanical experiments and conditions that exist and have existed perhaps for centuries before this great empire came under our government.

From time immemorial, since the first sowing of the seed in this north-land by the hand of the All-Divine Planter, the wild flower has borne life from its soil and lifted its graceful head and beautiful face upturned to the sun and blue sky, with as much vigor as any hot house plant or outdoor flower in California. As many as 130 varieties of wild flowers have been found in the district of Nome, between the 66th and 64th degrees north latitude, along the coast of Bering Sea. I have spent hours and days among the hills and lowlands gathering the little waxen petal flower—of every tint and color—so beautiful and dainty in texture and color that the sweet breath of heaven had but merely touched them and left the blushes of love messages upon their petals.

I found myself acquiring somewhat of a persistent fad, in searching for these feather-tinted flowers, that I might find one to outrival the other in color. I have walked miles upon the driftwood, along the overflow of Snake River (a name very appropriate to this river from its tortuous windings) in search of the cowslip, of the deep yellow hue, with the rubbery stems; also a small, white lily, with shell-like tinted center, with these same long shrubby stems, which grew along the water's edge. They seemed conscious that I was in search for them, for they were in hiding here and there among the driftwood.

The foothills and lowlands that slope down to the sea, through the months of June, July and August, are veritable gardens of wild flowers, mosses, ferns, etc. The reindeer moss is the moss upon which the reindeer subsists; it takes the place of grass and grows everywhere in abundance. It is of a silvery gray and various shades of green; turns gray after frost, but remains nutritious. This moss forms beds everywhere for the wild flowers and ferns. As you wander through the lowlands following the small streams toward

the majestic Sawtooth range—with its snow-white caps—forming a back ground to the soft old green of the foothills, you see a picture of grandeur and beauty.

Among these foothills flowers are to be found in extraordinary growth and strength; the white and blue, violet, sweet Williams, bluebells, lilies, buttercups, Marguerites as large and beautiful as the cultivated ones. The tall for-get-me-nots in the rich, delicate blue, and the white, can be found by the acres, spreading their fragrance. These, to my mind, are the most bewilderingly beautiful of all.—By a writer in the Washington Star.

THE CALLADIUM AND ITS LESSON.

What a teacher Nature is! Her students find songs and sermons and lessons on every page of her great open book. Did you ever get the lesson suggested by the calladium—that great elephant-eared-like plant so common on our lawns? Watch its development. Each germ of its bulb or tuber send up a single snoot or stem which soon after leaving the ground develops into a leaf, though small and insignificant as compared with other leaves developed later and in succession from this first one. Folded in this leaf-stock born soon after this first leaf fully expanded. This second leaf has an ambition to be larger and more perfect than its parent, an ambition that is fully realized, if it lives. Its leaf-stock in turn furnishes another leaf, larger and better in every way than its parent, and thus there is a progressive development until the last leaf is many times larger and more beautiful in form and shading than its original.

Should there not be a similar development in human life and character? Ought not the son and daughter with the added opportunities that come to each successive generation be stronger and greater intellectually, morally and physically than their parents—whether these parents are poor or rich, low or high, uncleaned or learned, vicious or virtuous, sick or well?

If every boy and girl, in every home in every land should they imitate the calladium in growth and development. They should put forth every effort to be better in every way than father and mother; the old world would soon be a veritable Paradise, with precious little use for constables or sheriffs, for prisons, poor-houses or police. Nor would there be nearly so much use for lawyers, doctors or even preachers. We would have to put up with the undertakers all the same. Let us be calladium-like—let us be progressive!—Josiah Forrest Kennedy.

CHILDISH INNOCENCE.

"Gracious, Fanny!" exclaimed a mother to her little daughter, "why are you shouting like that? Why can't you be quiet like your brother?"

"He's got to be quiet," replied Fanny. "He's playing papa coming home late."

"And who are you playing?"

"Oh, I'm playing ybu."—Harper's Weekly.

GOOD ENOUGH SULKY PLOW

The Vegetable Garden

NEXT YEAR'S GARDEN.

THIS is a good time to get ready for next year's garden. Compost your stable manure, poultry manure, ashes, weeds, every old thing which will rot and have something valuable for the rows of choice vegetables next season.

Prepare ground as it becomes valuable for future cropping. The mechanical condition may be improved by spading or plowing a liberal supply of coarse manure, and if it is very 'dobe,' apply a dressing of gypsum.

Disposal of rubbish in a compost pile will accomplish two things: First, give a good article for future use in garden. Second, get rid of breeding place for next year's cutworms.

Get off the superfluous grape

yellowish pulp that has the peculiar guava flavor. In the middle part of the pulp the small seeds are embedded.

There are several varieties of the common guava which are sometimes cultivated; distinguished by the shape and size of the fruit, color of pulp or skin, or paucity of seeds. The best guavas sometimes form desert fruits, or are eaten stewed with sugar, or are made into preserves. The firm jelly prepared from this fruit is much appreciated by many good prices in Europe when put in an attractive form.

The guava is quite a variable plant, and therefore considerable improvement could be obtained by selecting and propagating the superior individuals by grafting or by cuttings.

Other species of cultivated guavas

cents per pound in 1907, for those in the natural state, and that of shelled peanuts imported in 1898 was 2.4 cents per pound, and in 1907, 4.5 cents. West Africa and the East Indies are the principal sources of supply of the peanuts entering the international markets of the world. The exports of peanuts from the French colony of Senegal on the West coast of Africa were, in the latest available year, over 300,000,000 pounds; those of British India being a little less than 200,000,000; Gambia, on the West coast of Africa, about 100,000,000; the Dutch East Indies about 50,000,000, while China, Japan, Argentina, Spain and the United States also supply comparatively small quantities.

When this fiscal year closes we shall have to list peanuts for nearly \$1,000,000 of our total foreign commerce for the year, according to the Bureau of Statistics of the Depart-

Cabbage needs the ground stirred often. You can plow them up until they head to advantage. To grow the best cabbage it would be well to cultivate once a week until they are grown. No crop responds more to work and manure than cabbage. You can hardly put too much of either. You can plow with a cultivator or a broad-sweep, and can keep clean and crust broken in row with your hoe. It will pay to stir the soil even when there is no grass to kill.

Thorough tillage destroys weeds, but accomplishes more. It breaks up the caked surface of the soil, thus obliterating the capillarity that brings moisture to the surface and allows it to escape; a dust mulch is established. Tillage loosens the soil and admits a free circulation of air; in this way oxidation is promoted. At the same time roots penetrate the loosened soil more easily.

By frequently using the rake a saving of labor may be made in the garden. Very young weeds may be easily destroyed by passing the rake between the rows, while by allowing the weeds to remain until well rooted a hoe may be necessary. Economy of labor is in keeping weeds and grass down as fast as their seeds germinate.

Grapes are a winter-keeping fruit and are very valuable for that purpose. What greater luxury or more wholesome than fresh grapes on the table all winter and no one so poor who may not enjoy plenty of his own growing. The value of grapes for winter use is not fully appreciated.

Possession is said to be nine points in law. This is certainly true of weeds. When they once get possession of a field it takes about nine times the labor to get rid of them that would be needed if they had been held in check from the start.

In no place do asparagus, green peas, green corn, berries and similar delicacies taste so good as in the well-ordered home around which they are grown.

When good plans, pluck, industry and economy bring success to one it galls him to know that his neighbors say, "Jim always was lucky."

Strawberry Plants

500,000 each of Brandywines and Excelsiors ready for August planting. My plants are thoroughbred—the only kind its worth while to plant. Brandywines, \$2.50 per thousand; Excelsiors, \$3.00 per thousand. Other varieties later with a full line of small fruit plants. Catalogue ready about September 1st., which I will gladly mail to all who will send their address and mention this paper.

THE GUAVA.

The common guava (Psidium Guava) is a member of an American family of about 130 species, many of which have edible fruits. It belongs to the order Myrtaceae, and is related to the rose-apple, Java plum, cinchona cherry, pomegranate and guava.

The common guava is a shrub of 6 to 15 feet high. The leaves are papery, elliptical-oblong, with depressed pinnate veins. The flowers, about one inch in diameter, are borne in the axils of the leaves, one or more in each axil. The flower possesses a tough green calyx, which splits irregularly when the bud opens, allowing the expansion of the four to five white petals and the numerous stamens.

The fruit is commonly oval or globular, of lemon-yellow color, and is encased with the dry calyx. It is fragrant, and on healthy trees may be two to three inches long. The tender skin encloses a reddish or

PEANUTS.

Peanuts are beginning to form an appreciable and rapidly growing item in the foreign commerce of the United States, especially in the import trade. Despite the fact that this country produces probably twelve million bushels of peanuts annually, her exportations have been in such inconsiderable quantities that the Government Bureau of Statistics has only recently found it necessary to include peanuts in its list of articles exported. Meantime the imports have also rapidly increased and the total foreign commerce in this article in the year about to end will aggregate nearly one million dollars, the imports having grown in value from less than \$5000 in the year 1900 to about a half million dollars in the present year, while exports for the year will approximate about three hundred thousand dollars. Prices of peanuts have also greatly advanced in the foreign markets, the average valuation of imported peanuts, based upon wholesale prices in the markets from which they are sent to the United States, having advanced from 1.1 cents per pound in 1898 to 3.4

ment of Commerce and Labor.

The peanut acreage in this country increased 150 per cent and production 233 per cent between 1890 and 1900. There are under cultivation now 517,000 acres, producing 11,905,000 bushels. The crop is concentrated in a few Southern States, Virginia supplying one-third of it, North Carolina another third.—Coleman's Rural.

PLANTING TOMATOES.

Any ground that will grow potatoes is good for tomatoes. Plow the ground, harrow and drag till it is well pulverized, lay off in rows about four feet apart and set plants about four feet in row.

When setting, cover all the stem up to the leaves. This has a three-fold purpose. It protects the plants from drought, keeps them from breaking down during a wind and gives them more room for roots.

Cultivate as for corn or potatoes until vines cover ground and there is danger of breaking them. If vines are pruned and tied up to a stake the fruit will be larger and more uniform in size, but vines do not yield as many tomatoes as those left to spread on ground or on a rack.

We find they do splendidly and the fruit keeps clean if they are mulched with straw after they are cultivated the last time.

California Horticulturally

THE WHITE FLY PANIC.

THE White Fly is still the all-absorbing topic of interest with the orchardists of the State, especially of those interested in citrus fruit. The discovery of this pest has been a good story for the daily papers and they have not failed to make the most of it, and one would think to read some of the articles regarding it, that it was about to sweep like a tornado over the State leaving death and destruction in its path.

There is no question that this is one of the worst pests that has ever obtained foothold in our State; that it is a threatening danger to our citrus industry, and that every effort should be taken to prevent its spread, if it cannot be stamped entirely out. But there is still no need for panic. It has probably been in the section in which it is now known to exist, for the past three years, steadily increasing and spreading over a limited area. Even if no efforts were made to check it, it is probable that it would be many years before it obtained a footing in the great citrus section of the State. So, while immediate action is necessary, and has been taken, there is ample time in which to check its spread and comparatively little danger of its getting outside of its present limited area.

State Horticultural Commissioner Cooper has taken immediate and active measures against the pest, and it is now so far under control, that with careful watching—and this is a work of several years to come—there is very little danger of its spreading, and every probability of its being entirely suppressed. With the work that has been done, with the care that is planned to guard against it in the future, and with equal care on the part of the different County Boards of Horticulture, there is a very small chance indeed of its spreading to the citrus sections or even getting out of its present limited area.

BIG PRICES FOR FRUIT.

As the season advances there is no diminution in the prices commanded by fruit, and it is evident that the present season will be the best, so far as prices go, that our fruit growers have had in many years. Prunes have sold as high as \$40 on the tree. Apricots have been sold at \$100 per ton, and none commanded less than \$60. Peaches are quoted at \$60 to \$90 and pears at \$70. Of course, these prices are due to the smallness of the crop and are not likely to continue, but they contain a hint to the fruit grower and show what might be done by co-operation, which would preclude the possibility of glutting the market in seasons of good crops. Dried peaches are quoted at 12 cents a pound and apricots have sold at 25 cents. These prices recall old times when fruit growing paid.

SWALLOWS ARE BENEFICIAL.

The Watsonville Register says that "George W. Sill has made the discovery that swallows are feeding upon the beneficial ladybugs that have been doing great work in annihilating fruit pests in his orchard. The birds have been caught with the

goods and Mr. Sill has declared war of extermination upon the feathered marauders."

Swallows are wholly insectivorous birds and catch their prey on the wing. Naturally, they do not seem to discriminate what is good and what is ill from our standpoint, but catch any insect that flies. In this work they will frequently capture ladybug and other beneficial insects, but for every beneficial insect so caught they capture a host of injurious one and can be forgiven for their ignorance of what we require of them. The swallow is among the most beneficial of all our birds and should be protected by every means, and not exterminated because among the myriads of injurious insects devoured by it, it sometimes captures those which are of service to us.

LITTLE PEACH BLIGHT.

There was quite a peach blight scare last season, caused largely by the knowledge of the serious damage done by the pear blight, and it was generally supposed that the peach blight was a kindred disease. It was stated in these columns at the time that the disease was of a fungus nature and its spread was due largely to climatic conditions, that it was not likely that it would be serious this season, as conditions would probably be different. The result has proven this true, as reports from all sections are to the effect that it has done little damage this year. The pear blight, however, is a different proposition. It is bacterial disease and is here to stay.

FRUIT GROWERS TO MEET AT MARYSVILLE.

It has been definitely settled that the next Fruit Growers' Convention is to be held at Marysville. This is in the way of a concession to the city for the losses its people have submitted to in the destruction of their orange trees to prevent the spread of the White Fly. The convention will open on Tuesday, December 3rd, and among other matters of importance to be considered, the White Fly will, of course, occupy a leading place.

PARASITES FOR DISTRIBUTION.

Parasites for the codling moth are now being sent out from the secretary of the State Commission of Horticulture, at the Ferry building, San Francisco. These insects are breeding out in large numbers and being widely distributed. Reports from sections where they have been established in the past speak well of their work.

GOVERNMENT ENTOMOLOGIST HERE.

Prof. Quintance, one of the leading entomologists of the United States, and who is connected with the Bureau of Entomology at Washington, has been making a tour of the State during the past month in the interest of his department, and for the purpose of establishing stations for the study of various insect pests in the State. The work will be left in the hands of Dudley Moulton, formerly Horticultural Commissioner of Santa Clara county.

In rare families as in rare books the editions are limited.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

With the Citrus Growers

FIGHTING WHITE FLY WITH FUNGI.

A bulletin by Dr. E. W. Berger on Florida White Fly conditions, we note that nature's method of being used in Florida. With it goes the spraying. And later, on Mr. Strong's reports, we learn fumigation is still more successful. Regarding the Fly fungi, we quote from Dr. Berger:

The exceptionally low temperature Christmas time of 1906 has resulted in a partial or complete defoliation of citrus trees in some northern sections of Florida, and this again brings up questions of White Fly control under such circumstances.

Fungi.

In trees and groves where the deadly fungi (the Red, Yellow and Brown) parasitic upon the White Fly are found in abundance, it is advised to collect large quantities of dead leaves still clinging to the trees, or fallen leaves, with plenty of fungus upon them. These should be dried and stored, since the fungus may be useful for again starting it on the trees and groves next spring. Methods for introducing the fungi by spraying the spores suspended in water on the leaves infested with White Fly, or by pinning on leaves, when dried have been developed. The fungi when dried have been found to retain their vitality for two months, and further observations may extend this time. Should the leaves with fungus collected prove useless by the time that they are required, little or no will have been lost. Specimens sent to the station at the proper time will be gladly tested for their vitality.

History Facts.

During December, January and February there are probably but few any unhatched eggs or adults of the White Fly; all are in the young scale-like stages and live attached to the under surface of the leaves. They are easily killed by spraying while in these stages, provided, of course, that the spray comes in contact with them. Drying the leaves will kill them, hence all the young insects on leaves dropped by freezing will, with the possible exception of those nearly matured. For the latter reason all dead and dropped leaves should be destroyed, plowed under or burned, excepting those wanted for the fungi on them.

Completing the Work.

Now, in view of the fact that freezing has begun the work of defoliation, it appears desirable to complete or take advantage of the reduced number of leaves and spray with the termination to kill every remaining White Fly larva upon the tree; even going to the extent of using a spray sufficiently strong to complete the defoliation. One drastically thorough spraying at any time is better than several less thorough ones. Spraying, furthermore, cannot be made effective unless all co-operation. If but few green leaves remain on a tree it is advised to complete defoliation by trimming. If, to complete defoliation, spraying is adopted, this should be done at once before the new buds start.

While in the above the writer has emphasized spraying, yet he does not

for a moment desire to leave the impression that he is an unqualified supporter of spraying for the White Fly. On the contrary, he considers spraying only in the light of an expedient, a makeshift, and firmly believes that the solution of the White Fly problem is closely bound up with whatever success we can achieve in devising sure and ready methods for introducing the fungi and other parasites. In other words, the solution of the fungus problem will be the solution of the White Fly problem, and it is believed that the solution of each is at hand. The reader is again referred to Bulletin 88, which will be ready for distribution in a few days.

For more complete spraying of

information as to their methods and results in citrus culture. By incorporating this information with the proceedings of the Institute into a systematic bulletin on citrus production it has seemed that a much more valuable and authentic publication can be produced.

The survey will be completed within the next month and a bulletin then issued, showing the most noteworthy methods and results in various sections and various types of soil, rather than simply a disconnected series of papers written from a limited number of local standpoints.—Ralph E. Smith.

MEDITERRANEAN FRUIT FLY IN AUSTRALIA.

Consul-General J. P. Bray reports from Melbourne that much consternation has been caused by the discovery in many of the orchards in the State

orchards of the whole of Victoria is to be made and every possible step taken by the authorities to eradicate the evil and prevent its further introduction by either the total prohibition or a rigid inspection of all fruits imported from places where the pest is suspected to exist.

California doesn't want this fly and no effort is too strenuous to so guard our ports as to exclude it.

The following recipe for a waterproof paint for wood or stone will be found reliable: Melt twelve ounces of resin; mix it thoroughly with six gallons of fish oil and one pound of melted sulphur; mix some ochre or any other coloring substance with a little linseed oil, enough to give it the right color and thickness; apply several coats of the hot composition with a brush. The first coat should be very thin.

Farming is no better and no worse than any other honorable occupation. All depends upon the man. There is plenty of room anywhere to show character and brains, and likewise to exhibit all kinds of stupidity and meanness. Anybody can find his place, and that usually without changing his occupation.

White Fly in Kern County

ANOTHER pest center has been found where the White Fly, *Aleyrodes citri*, has a firm foothold. This time it is in Kern county and two or three hundred miles nearer the great citrus orchards than the Marysville infestation.

The trees infested are on the ranch of W. S. Tevis. E. K. Carnes of the State Commission has given a thorough inspection and found all of Mr. Tevis's citrus trees affected and immediately ordered a quarantine, which has closed the beautiful grounds to the use of the public.

The associated press reports: "Mr. Tevis considers the discovery of the White Fly a great blow to the agricultural interests of the country. He explains its presence on his property by believing citrus plants imported from Florida two years ago were affected and in their transplanting gave rise to the spread.

"It is probable that all citrus trees on the big estate must be destroyed to prevent the spread of the pest. Tevis is greatly disappointed, as a collection of rare and valuable trees has been his chief hobby and those which he had at Stockdale represent the selection of a lifetime."

rections see Bulletin 76 of this Station.

Plants to Comdemn.

It is also pertinent to the subject in hand to emphasize the necessity for destroying all unnecessary breeding places of the White Fly. Under this head belong the following trees: Cape jessamine, privet hedges, all useless and abandoned citrus, china-berry and umbrella trees, viburnum nudum, and the mock orange (cherry laurel) when infested. Of these the cape jessamine may be defoliated, but the work must be complete. All the others should be cut down and burned. During summer these trees are such prolific breeding places for the White Fly that the latter becomes scattered far and wide.

PROCEEDINGS OF THE RIVERSIDE CITRUS INSTITUTE.

In response to many inquiries we would announce that the publication of the papers and addresses of the Citrus Convention held at Riverside, in January, is in preparation, but has been somewhat withheld for the collection of additional data along the same line. The suggestion was made at the Institute that this material would have much greater value if supplemented by fuller and more definite information as to citrus cultural practice, collected personally from some of the most successful growers in the various sections.

With this idea in mind a citrus survey has been undertaken by the station, sending representatives to a large number of growers in all the important citrus districts of Southern California, and securing from them

of Victoria of the existence of the pest known as the "Mediterranean fruit fly. He writes:

It has been positively identified by the government entomologist and has been found in many widely distant localities. The orchards of the States of Queensland and New South Wales have been subject to the pest for some time, and as the result of an investigation just made it seems to be conclusively proved that Victoria owes its introduction to the importation of bananas, oranges and cucumbers from the former State, as the larvae of the fly has been discovered in large numbers on those fruits when landed on the Melbourne wharves.

A thorough inspection of the or-

Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

WINTER FUEL.

If we are to judge from what we read in the daily exchanges, fuel is going to be scarce again this winter, especially coal. Last year much suffering was endured because the coal supply ran short at a time when it was most needed.

We would advise our readers, who are not within reasonable distance from towns, to put in their fuel early. It will probably be no cheaper later, and it may be higher. The best course to pursue is to provide against want while the opportunity exists to do so.

Better still, why don't the farmer grow his own fuel? It's easy. It's economical. And it gives absolute independence.

FRUIT GROWERS ANXIOUS.

The visit of Secretary Wilson to the Pacific Coast will result in benefit to the fruit growers of California. In a meeting held at San Francisco, last week, the secretary listened to the protests of representatives of the dried fruit industry from several points in California against the ruling of the department on the maximum amount of sulphur prescribed for use in dried fruits. They undertook to show the secretary that if the present ruling is adhered to immense damage to the fruit growers will result.

They inquired if they would be prosecuted if they did not use the formula prescribed by the Department of Agriculture and plainly told the Secretary they would be ruined if not allowed to raise the maximum of sulphur laid down by the chemists under the Pure Food Commission.

In reply Mr. Wilson told the fruit men that the Pure Food Commission would not proceed against them or against any class of producers of foods who honestly, by the best light they have, endeavor to conform to the rulings. "I have given this assurance to many perturbed interests," said he, "and if modifications in your case are necessary to protect you, they shall be made. I am a farmer myself, and it would ill become me to do anything against your welfare."

With this assurance the growers are going ahead, sulphuring their fruit in trays, convinced no injustice will be done them by the government if they do the best they can to save their fruit.

FACING LUMBER FAMINE.

Secretary Wilson says the United States is facing a lumber famine. He is not the first one to make this declaration. Statisticians have said also, that in a comparatively short time, our timber belts will be exhausted and we shall be out of lumber for building purposes.

Although the Federal government is doing all in its power to ward off the peril, having set aside 150,000,000 acres of forest reserve lands, the prospective famine, according to Secretary Wilson, can be prevented only by the individual holders of forest lands or by State laws.

"The waste has been incalculable," says Secretary Wilson, "and the increased cost of lumber at present heralds an impending famine. The loss by forest fires alone amounts to hundreds of thousands of dollars every year."

In reply to a question as to the probability of the Federal government taking some action for perpetuating the forests by replanting, Secretary Wilson said recently:

"It will have to come to that in time, but the checking of the present peril rests with the State and through State laws. The greater part of the Eastern and Middle West country now looks to the Pacific Coast for its lumber, and if the Coast States wish to maintain this profitable industry in the future, they will have to pass and enforce suitable laws governing it."

THE TEN ACRES TRACT.

Very often the Cultivator receives inquiries from Easterners desiring to come to California, asking what can be grown on ten acres with profit.

The question is, and is not, difficult to answer. Climatic conditions are so varied in this State, and the markets are so different, from season to season, that anything like a hard and fast rule is not easily laid down. These points make it hard to speak from the card; but, on the contrary, there are so many products which may be grown on ten acres to advantage. We feel little hesitancy in saying that with proper climate, water for irrigation and intelligent cultivation, a dozen or more products may be grown, any one of which will give good results.

A farmer does not actually need ten acres to make a good living on. Five acres well tended, in a good location, near market, with proper soil and cultivation, water of course included, will make any man a good living. Vegetables, fruits, nuts will pay, while alfalfa and a few cows will make money.

All any man needs in this State is land and water, location near a good market and horse sense to make money. Better five acres than ten if rightly farmed, for in proportion as much or even more money can be made.

The advice to all newcomers to California, which the Cultivator would give, is to study well the conditions of the locality which pleases you, find out what is best suited to its conditions, and farm in accordance with that information.

HUMANE SHIPMENT OF STOCK.

Congress at its last session passed an important amended law relating to the humane shipment of live stock. For three preceeding sessions this matter was before Congress and Secretary Wilson was doing all he could to have a humane live stock shipment law passed.

The importance of the statute will appeal to the farmers and packers, not only from a business point of view but from a humane point as well,

because as the Journal of Agriculture states, "it assures that cattle, hogs, sheep and other animals will reach the market in the best possible condition."

Those of us who have been shippers of live stock know to our sorrow the losses sustained on every carload of hogs and cattle sent to market, because of the neglect of the transportation companies having them in charge. The new statute provides heavy penalties for the mistreatment of stock in transit on trains, boats, etc., and much good has already been accomplished by its enforcement. The new law requires railroads to feed and water stock at station intervals, and to furnish ample room for animals in stock cars. It also provides for regular care of stock and comfortable quarters on boats. The live stock industry is one of the greatest branches of agriculture, so that any movement looking to the betterment of conditions affecting the animals or their owners, should receive the hearty support of all classes of people. The humane side of the question should bring every citizen to the support of the measure regardless of whether he is a shipper or not.

AGRICULTURE AS A SCIENCE.

The President, in opening his address at the recent semi-centennial celebration of the Michigan Agricultural college, made prominent reference to a fact which the agricultural world has probably overlooked. He stated that the Michigan Agricultural college was the first college of the kind established in the United States and which has maintained continuous existence up to the present time. The subsequent history of agricultural colleges dates from the Morrill act of 1862. This act passed by Congress provided for land grants by the government to the nation to encourage State colleges for education along agricultural lines.

The distinctively agricultural college dates from Michigan's action in 1855. In most States of the Union such schools are now recognized as essential adjuncts of the educational system. Farming methods have been wonderfully revolutionized in the last half century and even in the last quarter century. Scientific knowledge is as necessary to complete success as in other branches of industry. The farmer who wants to make the most out of his occupation must keep in close touch with all that intelligent investigation is making known.

TAKE A DAY OFF.

"Some farmers think," says the Deseret Farmer, "that they cannot spare a day from their work during the summer time. We do not believe there was ever a farmer who lost anything by taking a day off and visiting the Experiment Station, the County or State Fair, or the Farmers' Institute. The successful farmer is using more brain and less brawn."

It is an encouraging omen of the progressiveness of our California farmers, that they quite generally attend farmers' institutes. Still the number is not as large as it ought to be, for these institutes are the source of immense value to the farmer in the information they impart.

Kansas wheat growers are distressed beyond any previous years to obtain labor to harvest the crop. The papers say the farmers meet all trains and offer as high as \$3.50 a day to every man who will stop and work. In the towns the business men have entered into an agreement to close their stores and let all their male employees go to the harvest field until the wheat is in the shock. The Santa Fe, Union Pacific and Missouri Pacific railroads have been appealed to for help, and it is proposed to have all the shopmen, track walkers and as many trainmen as can be spared laid off and sent to the harvest fields for a month.

"Why is there a tariff on lumber when not enough can be had in this country to meet the daily needs?" Asks the North Dakota Farmer. "Have you ever thought of this? Or why is there a tariff on farm machinery? Is it not time that the American farmer had some protection and not the lumber barons or farm machinery trusts. Farmers, think it over and then ask your U. S. Senator what he thinks of it?"

News of Country Life in the Golden West

Southern California

Northern California

AGRICULTURE.

Lawley is to have a new creamery. A resurvey of the Imperial Valley is to be made.

Paheim estimates \$50,000 as the return from her spud crop.

Orange county honey output will aggregate about one hundred tons.

Coachella Valley claims the output of 10,000 worth of Bermuda onions.

Orange county celery crop is promised to be one of the biggest and best ever.

See Warden Reed of Riverside has force of men shaping up the street in that city.

President Roosevelt has by proclamation added thousands of acres to Sequoia forest reserve.

Secretary Garfield is reported to have said that the Laguna dam is a key to the control of the Colorado River.

In Bernardino county bee inspectors reports that the colonies of bees killed last year for foul brood show no disease this year.

Canaster, in the Antelope Valley, claims one of the biggest balers ever built. It is the property of the California Colonization Co.

State Dairy Inspector Star is after Santa Ana dairymen and is threatening arrests unless corrections in the milking methods are made.

A big scheme of the Covina people to have vast quantities of storm water for summer use is still being pushed, and is deemed a wise move.

Judge Wellborn of the U. S. District Court has rendered a decision invalidating a \$31,000 bond issue of the Riverside irrigation district.

The government is busy strengthening the levees of the Colorado River near Yuma. This work is made possible by the lowering of the river. Secretary Garfield in his visit to California made a personal investigation of the Laguna and Roosevelt dams being constructed by the Reclamation Service.

The land frauds developed in the clearing up of government claims in the Imperial Valley are being investigated by the United States Land Office at Los Angeles.

A woman at San Bernardino, who was exasperated by boys stealing her fruit, took a shotgun and her aim being good, she seriously wounded a ten-year-old boy.

The lands about Beaumont are promised extensive improvements in the near future owing to a recent transfer from the San Francisco bank to a live company which will develop them.

The Pasadena veterinarian, who has been endeavoring to give the tuberculosis test to all cows furnishing milk in that city, has found he is up against a gigantic job. He says it will require one full year to make all the tests.

A plan is being worked out to secure the "sweetening" of the waters of El Estre Lake. It is extremely alkali, owing to vast deposits washed into it, and the scheme contemplates running a tunnel draining away the water and removing the alkali, then when filled with fresh water. It will reclaim 10,000 acres of arid land.

HORTICULTURE.

"Oranges ripe in six weeks" is a heading in the Riverside Press.

Azusa claims strawberries five and one-half inches in circumference.

One ranch at El Modena will ship three hundred thousand rose bushes this season.

The exact count of the Redlands district shipment of oranges makes a total of 4062 cars.

Ventura claims to be the home of J. A. Day, who first introduced the sulphuring of fruits.

The Duarte-Monrovia Fruit Exchange has paid its members \$171,000 within the past season.

One acre of Riverside strawberries will net its owner \$1000 as a result of the last year's culture.

Twenty-five carloads of watermelons were shipped from the Coachella Valley this season.

Riverside claims to be the headquarters for oranges, and is now boasting over the finest peaches ever.

Ventura apricot growers are making every effort to secure a change in the ruling of sulphuring of fruits.

Commissioner Cundiff of Riverside county is experimenting with a new emulsion for the eradication of scale.

Another shipment of date trees from Africa into the Imperial Valley is promised by the government in the near future.

Coachella grape growers are having trouble with large numbers of quail which are making a raid upon the ripening grapes.

One hundred and fifteen Valencia trees at Redlands brought their owner a total of \$1510, or an average of over \$13 per tree.

In Ventura, the second county in the State in apricot production, orchardists have organized to look after the interest of the apricot industry.

The Orange Heights Fruit Association of Corona has purchased the packing-house of another company and in the future will handle both oranges and lemons.

Several Banning apricot growers report a yield of seven to nine tons to an acre. Robert Dixon received \$3180 for the apricots on 760 trees, and the buyer picked the fruit.

Agents of the Department of Agriculture are at Highland investigating the secretion of gum on newly-budded orange trees which has been more or less perplexing this year.

San Bernardino County Horticultural Commission cost the county about \$1000 per month, but active work is constantly under way in charge of Commissioner Pease.

The Southern California Fruit Exchange Eastern representatives are in California gathering information as to the coming fruit crop which they will sell the Eastern consumers next season.

Hemet has Redlands skinned a block in regard to its two lemon trees mentioned in a recent Cultivator. A. L. Rollins of Hemet has two lemon trees that brought him \$45 this year. This sum paid his entire taxes and irrigating and domestic water on his ten acres for the year.

AGRICULTURE.

The Porterville Enterprise urges everybody to plant figs.

Turlock cantaloupes sold for \$1000 in Chicago last week.

A large company is looking for location of cannery at Fresno.

A fruit dryer, near Saratoga, Santa Clara county, believes he has discovered a method of drying fruit without the use of sulphur.

Sonoma county has two hundred and twelve thousand bearing apple trees and five hundred and twenty nine thousand bearing prune trees.

The Selma packing house is running out large quantities of canned goods and is also buying dried fruit, regardless of the sulphur ruling.

A fruit grower near Porterville estimates that the crop of oranges will be very fair as to quantity, but that in size the fruit will be rather small.

Certain papers are declaring that Prof. Woodworth of the State University, has charged that the work against the White Fly in Marysville, has been a failure.

The story of boring of a hole into the heart of blighted pear trees and plugging up with Bordeaux or with some other mixture, has again been started in some of the Northern papers.

The residents, and especially the county inspectors at Marysville, are nettled by the insistence of the State University in taking a hand where Marysville claims it is not wanted.

Dried fruit producers, at Hanford, have delivered apricots to the Armsby Co. which had been sold on contract, but were refused because of the pure food rulings on the sulphur question.

The Exeter Sun says the fruit growers of that section are waging fierce war against fruit stealers. It is to be regretted that such steps are necessary, but the farmer must protect himself.

Papers in the lower end of the San Joaquin valley claim the cooler summer weather which has prevailed this year is owing to the larger body of water in the Tulare lake correcting its climatic conditions.

An appeal for an injunction asked for by Marysville fruit growers who did not wish to have their trees defoliated, has been refused and the State Board of Horticulture sustained in its right to disinfect.

The first brood of codling moth at Watsonville is claimed to be very active and doing much damage. It is claimed to be caused by the warm weather which has prevailed this season, and to the further fact that less thorough spraying has been the rule this spring.

Deciduous fruit dryers are feeling more reassurance in the dried fruit situation owing to the recent ruling in the department in which it is stated that "there is a disposition on the part of the department not to harass growers and packers in California." However, warning is given not to use an excessive amount of sulphur.

HORTICULTURE.

Hop harvest has begun in Sutter county.

The first lot of buildings at the State farm, at Davis, are completed.

Tulare grange is taking active hand in preparing for the Tulare fair.

The new Porterville creamery is turning out about 300 pounds of butter daily.

One hundred cattle were killed in a grass fire in the hills back of Lindsay last week.

The Turlock irrigation district is to extend its ditches so as to cover 10,000 acres more of land.

Petaluma is shipping eggs by the shipload to Alaska. The shipment consists of 1,728,000 eggs.

Stockton estimates that \$125,000 will be received from the onion crop of that section. Over 50,000 bags have been shipped already.

Pacific Sugar Company's plant, at Visalia, is a busy place with one hundred and fifty men turning out about forty tons of sugar daily.

Tehama county expects great benefits from the construction of the government for the Iron Canyon dam which is now confidently expected.

The work on the Big sugar factory at Corcoran is now well under way, and it is claimed a round million of dollars will be spent on this great property.

San Benito county poultry raisers have combined in rebellion against the charge for returning the empties under the new ruling of the Express Companies.

San Joaquin county claims to raise by far the largest portion of the potatoes of this year. There are over twenty thousand acres planted to potatoes in that section.

The Buena Vista levee break in Kern county has been closed, but there is still fear of further break and workmen patrol the section of danger night and day.

Visalia's effort to construct a large drainage canal around the city has failed because of the cost being greater than she could bear at this time. The estimate is approximately \$100,000.

The Pacific Sugar Company, at Visalia, is considering the building of about twelve miles of road as the feeder for its factory from sections where they cannot get livable freight rates.

The Ukiah Times reports some sales of hops at six and one-half cents. One purchaser is offering to make contracts for hops for the coming three years at ten and one-half cents per pound.

The Co-operative creamery now in operation at Porterville promises to be a complete success, not only as an institution, but for the farmers living in that section who will be enabled to command better returns for their productions.

The Alta Advocate, of Dinuba, refers to a farmer's purchase of three pigs for \$7.20 which after four and one-half months' feeding on skim milk he sold for \$72. We imagine there must have been some alfalfa mixed with the skim milk.

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention, will be answered through these columns.

IS YOUR POULTRY PAYING.

PERHAPS there is no branch of work on the farm that is run, regardless of profits as is the poultry yard. We have seen good flocks of poultry that had been turned out to shift for themselves just at the time when they should be given attention and be paying. It is an undisputed fact that the farmer can produce both fowl and eggs cheaper than the "city lotter," and yet we believe that if more care were taken in selecting, culling and feeding the flock that still more profit would find its way to the good housewife's purse.

How Many Are Laying.

My dear reader, did you ever try to cull your flock of the non-layers? Do you know that in all flocks of from 100 to 200 hens that a large per cent can be culled and sent to the block and yet you will get as many eggs. If you have never tried it, do so, and see the results. There are many ways of picking out the layers. One way is to use trap-nests. Most all readers of the Cultivator know what the trap-nest is, as plans and descriptions have been published several times in the last few years.

Although there are many flocks where the trap-nest would not be practicable; especially is this true when the birds have not been yarded. Every flock should be yarded during the breeding season. If this is done the layers can be picked out and put in a yard by themselves. A very simple and practicable test was made at the State Polytechnic school at San Luis Obispo of 158 hens. The test was made as follows: An attendant watched the hens for three days, and out of 158 only 65 were found on the nest during this time. This left 93 that had not layed for three days and were taken out and placed in a yard or yards by themselves, while the 65 were yarded by themselves. All were given the same care and feed and a close record kept from October till March. The 93 showed a net profit of only \$6, while the 65 showed a profit of \$71, or nearly \$1.10 per hen.

This is only one way of testing, there are many others. There are a number of books published which would prove beneficial in selecting the layers.

Thoroughbreds.

We would also suggest that if you are not breeding thoroughbreds to get a trio or a pen this fall, set up a yard for them, get them to laying and set their eggs. In this way even with a trio you can soon get a good start of standard bred birds, which you will find will pay better than mongrels. Besides there is a beauty in an even colored flock not had in mongrels.

MOLTING.

A great deal is being written in the poultry and farm papers, especially at this season regarding the molt. Some advise forcing the molt, while others do not believe in it. But it is generally accepted that it is

best to assist nature and feed a lot that will be suitable for the formation of feathers and the general building up of the systems.

If we wish our flock to molt through the molt early and uniformly we can accomplish it very easily. The method is to withhold part of the feed for about three weeks, feeding principally of vegetables and green foods, lawn cuttings, etc. and leave out the grain and meat ration.

After you have had your birds on this ration for about three weeks you will find that they have lost much flesh and are very thin. Then you should feed a rich nitrogenous ration, either a good molting food, one consisting of beef scraps, corn wheat and oats, with a little linseed meal. Always giving plenty of fresh water and good sharp grit.

Birds treated this way and kept free from lice will come through a molt better and will begin to lay earlier and be in better condition than those that are left to drift through the molt.

AROUND THE YARDS.

Many people start in the poultry business that don't "stay started."

Now is a good time to plan your advertising for the coming season.

Ten dozen eggs a year is the estimate as the average production of the hen.

One of the best green feeds at this time of the year for the chicken which are not laying is tops of green onions chopped fine and fed with chopped feed. They are invigorating and have a tendency to correct bow trouble.

If your chickens fly from you make a vigorous effort to get out your way every time you enter the pens, there is something wrong with your handling of them and you will not get the results you would otherwise.

Blood spots in eggs have nothing whatever to do with the germ of life; they are usually due to the bird laying them being over fat and the organs being weakened thereby, an effort to force the egg into the duct causes an effusion of blood in the egg.

Paddy Doolan went into a shop today to buy eggs.

"What are eggs today?"

"Eggs are eggs today, Paddy," replied the shop man, looking quite triumphantly at two or three young lady customers who happened to be in the shop.

"Faith, I'm glad to hear you say so," replied Paddy, "for the last one I got here were chickens."

Yolk Not Absorbed

I am raising chickens this summer and have had much trouble with them. The parent stock are strong healthy Buff Plymouth Rocks and White Leghorns. Are in prime condition, properly fed and have a constant supply of grit, charcoal, etc. and fresh cold water. Under the same conditions I have always had good hatches and lost only a few, any, chickens. But this year the chicks hatch fairly well and are strong until five or six days of then some of them begin to droop and gasp a few times and die. When I hatch them in both hot air and in

ter incubators. Tested the thermometers and run at 103 degrees, with very little variation, as either birds the temperature well. Feed until 48 hours old, then take them to the brooders and feed grit followed by Peerless or Chamberlain's Chick Feed; give grit, charcoal and shell in shallow pans and feed the chick feed in chaff from the manger. Of course we see that the fountains are kept clean and fill several times each day. Also feed them alfalfa and lettuce-heads. In brooders each morning and only 50 chicks in the 75-size. We have examined several and found heart, lungs and liver in normal condition, but what seems to be the lack of the egg has not been absorbed and is in fine granules mixed frequently with a green putrid-looking liquid. Sometimes the chickens "pasted up" and those usually while those that are not die after sleeping fifteen or twenty minutes. Can you tell me what is wrong and what to do, or not do, to remedy the condition? I have raised only about half of the chickens hatched, but these are fine.—A. R.

The above is rather a hard one to answer, for by the letter we would think the chicks had very good treatment and we can see nothing that would cause them to die, unless it is that at some time during the hatch the heat in the incubator was too high. While this might not affect the hatch it might cause a chemical action on the yolk, which would keep it from being absorbed properly. We have heard of chicks not being able to absorb the yolks, where the parent stock were fed on slop. In case in particular, where eggs were purchased from slop-fed hens and put in an incubator seemed to hatch very well, yet the chicks died, as you say yours do, and by a post mortem examination it was found that they had not absorbed the yolk at all.

Any of the readers of the Cultivator have had similar trouble, we would like to hear from them; also cause and remedy.

Partridge Wyandotte Standard.

What is the standard weight and coloring of the Partridge Wyandotte?—A. R.

The standard weight of the Partridge Wyandotte: Cock, eight and one-half pounds; hens six and one-half pounds; cockerel seven and one-half pounds; pullet five and one-half pounds. Color, male, head plumage, face, bright red; eye, red or bay; back, dark brown shading to yellow point; neck red, with a distinct black stripe through each feather; back, dark red; saddle, red with black stripe through each feather; breast, glossy black; body and fluff, black, or black slightly tinged with red; wings, primaries black, lower red; secondaries black with outer web red; covarts, greenish black. Tail, greenish black; under color of each section dark slate.

Female's beak, eyes and face same as male; head plumage, reddish brown; neck, red with black stripe through each feather; back, breast, body and fluff mahogany-red or reddish brown, distinctly penciled with very dark brown, the outlines of penning conforming to slope of feather; wings, primaries dull black with an edging of brown on outer web; secondaries, inner web a dull black, outer web, mahogany-red. Tail, black or brownish black; under color of each section dark slate; color of skin of both male and female, bright yellow.

Gos or Canker.

What is the matter with my pul-

lets? They are nearly big enough to lay and are continually opening their mouths and die in a few days. Are fat and in good condition.—C. M., Arroyo Grande.

The above is one of many like letters we receive. Often letters do not contain enough information for us to properly diagnose the case. The only thing we have to go by in this letter is the "opening their mouths." This might be caused by two things: either gapes or canker in throat. We hardly believe that it is gapes in birds at this age. Therefore, we naturally suppose that it is canker. Treatment, examine throat and if there is a white cheesy growth in throat clean it out with a stiff feather or a swab made of a soft cloth. Then put germozone on full strength, or a good rouse medicine will do.

Treat the Setting Hen Kindly.

My Barred Rocks are the most persistent sitters I ever saw. I have tried the open air prison dodge to no purpose. They go back to the nest like a duck to water when I let them out. Can you prescribe for a subscriber, San Gabriel.

Because the hen wants to set when you don't want her to, don't loose your patience, but treat her kindly. Perhaps the reason your hens are such prolific persistent setters is because they are too fat. A hen that is fat will have more animal heat in her body and will be more inclined to become broody. The open air prison or slot-bottomed roof that you speak of is a good way to break up the broody hen. Keep coop protected from the sun with plenty of fresh water. Feed sparingly of oats, green food and chopped vegetables, taking away all fattening foods.

Another plan that we have found very successful, is to confine them in a small pen with a vigorous cockerel from four to five days. After a few days we turn them back into the breeding pen, but always do so early in the morning. With this kind of treatment and food they generally start to laying in a very short time.

Swell Head.

I have read with interest your interesting articles on the care of poultry in your paper and would consider it a favor if you could give me your advice on a disease that everyone in this neighborhood I have asked seem to be totally ignorant, in fact, it left me with the impression that their knowledge of the extent of raising chickens had gone no further than the production part.

I bought a few Plymouth Rock thoroughbreds when they were about two-months old, and after a week or so I noticed that some of them had a swelling over the ears and eyes and as my knowledge of chicken disease was nil, I began treating them for mites. After a week their eyes began to get sore, closing completely until I put some sweet oil on them, then they would open or keep open two or three hours, a discharge coming from them and close up again, then they began to get very poor and sore under the wings; now it has come to the point that if I cannot find something to relieve or cure them, I think it would be advisable to twist their necks and put them out of their misery.

Would consider it a favor if you will tell me which is best, I know your time is valuable, but if you will strain this point it will be appreciated.—E. S. P. S., Pomona.

Your birds have "swell head" and roup, caused by catching cold by roosting in a draught or it may be caused by infection. Find the cause and remove it. Then separate the well ones from sick ones and treat as follows: Rub the heads with

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

Silver's Clover Cutter

For Poultry

This machine will cut clover, alfalfa, straw, vegetable tops and similar material, green or dry, into 1/4 inch lengths, which makes it especially adapted to cutting feed for poultry. It is all iron and steel, consequently very durable. Length over all, 24 inches. Size of feed box, 18 inches long by 10 inches wide at rear end, by 8 inches at throat. Feed rollers are full width of cutting surface. Has 8-inch, 4-bladed, solid center, spiral knife, with adjustable cutter-bar, like a lawn mower. Capacity is a bushel of cut clover in 10 minutes or less. It is intended to be mounted on a bench or box to make it right height for operator.

carbulated vaseline. Purchase some reliable roup medicine and follow directions. It might be well to use germozone freely in drinking water, also use for bathing head and eyes.

Intestinal Worms.

Can you tell me what is the trouble with one of my spring pullets? For some days it has been ailing; its very, very thin, but has an excellent appetite. The droppings are yellow, sometimes soft, but generally firm. I have taken this chicken out of the yard and given it whatever my neighbors advised, with no apparent change. This is my first venture at raising chickens, so I know nothing about them.—Mrs. C. G.

From the description we would say that your birds have either what is known as "going hyht" which is really consumption, for which there is no cure, and is considered by some as contagious; we would remove same from flock. Or they might have intestinal worms. Treatment: give your fowls one teaspoonful of turpentine in equal amount of sweet oil, followed with a good physic. If the trouble is worms this will relieve same.

THE CORNISH INDIAN GAME.

In response to the "Cultivator's" request for an article on the "Cornish Indian Game," I wish to assure you that it is a pleasure to write or speak a good word for such an excellent fowl. I prefer to have others, of more experience with this breed, do the writing, but Indian breeders do not seem to be the kind to boom nor to make known the merits of their favorite fowl.

The Indian Game is an all-English breed, as they originated in Cornwall, England, about the year 1840, or soon after. They were made by crossing the "Aseel" and "English Game," and the progeny of this cross with the Malay, since then they have been greatly improved and new blood may have been used. The name is a mistake and a better name would be the Cornish Fowls. The "Indian Game Club" of America has changed the name to "Cornish Indians," and most of the American breeders are now using that name. The first record I find of their having been exhibited was at Crystal Palace, London, England, in 1858 and 1859, and for twenty years they were practically unknown outside of a few counties in England. In 1887 the breed was introduced into the United States. Dr. Clark of Indiana, claimed to have the first "Indians" in America. The writer was the first to bring them to the Pacific Coast, also the first to breed, exhibit and to advertise them on the Coast. At that time I had the "White Rocks," "White Wyandottes," "Black Minorcas," "White Leghorns," "Black Spanish" and "Pekin ducks" and later had other breeds, but have settled down to the "Indian Games" exclusively.

The "Pacific Indian Game Club" was organized about 1893 and did good work for a time. At one Northern show the members exhibited about fifty choice specimens.

But the readers of the Cultivator are probably more interested in the practical qualities of the breed than from a fancier's point of view, consequently I will tell what I know from the utility standpoint:

First—They are the best table fowl I know of.

Second—Good average layers.

Third—Their eggs are large, rich

and better flavored than others.

Fourth—Both male and female are beautiful birds, if well bred; double-penciled stock.

Fifth—They are good sitters and mothers.

Sixth—They are hard feathered, have very little offal and are easily picked and dressed.

Seventh—They are not a fighting breed—but as peaceable as any other.

They have always been very popular as a table fowl in England, where they rank above all other breeds for crossing. All first premiums at Crystal Palace, London, for table poultry were awarded this year to Indian Games and Dorking cross first, and second to Indian Games and Orpington cross. It seems necessary to have the Indian Game or Indian Game cross to suit the English palate.

The average American is in such a hurry, he seems to care but little if he eats chicken, or simply an apology for a chicken. Any old thing seems good enough, but the time will come when the "Indians" will "come into their own." To those who intend to keep a few fowls for their own use, I would suggest that they keep the best fowl for rich eggs and table use—the Cornish Indian Game.—John D. Mercer, Los Angeles.

HOW TO FEED GREEN CUT BONE.

While green cut bone is one of the best and cheapest feeds for poultry there is nothing that can cause more harm if fed improperly.

Being so cheap and the fowls so greedy for it, sometimes persuades the poultryman, who is inexperienced in its use, to grant them their fill—and usually not until the health of the entire flock is undermined

does he notice the harm that is being done.

A hen when unable to secure other animal food will consume half an ounce of cut bone a day, and keep in good health, but more than this is pretty certain to cause ill effects.

My best results in its use have been secured by feeding a mash in the afternoon, in which I place, when no other animal food is accessible, three pounds of bone for every hundred hens—about half an ounce per hen. Though my only experience has been with the Single Comb White Leghorn, I think this rule will apply to most any breed.

It is usually advised to feed an ounce every other day, but this certainly is not as good feeding as half an ounce every day, for a hen on the range, during the spring and summer months when the egg production is at its maximum, secures insect food every day; and to feed cut bone to excess one day and withhold it entirely the next, is not successfully imitating nature's way.—Poultry Success.

All the good things of this world are no further good to us than as they are of use; and whatever we may heap up to give to others, we enjoy only as much as we can use, and no more.

Coulson's No. 3

Condition Powder For Poultry

If you are not already using Coulson's No. 3 Condition Powder, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season.

If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

We Claim Coulson's No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in.

We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are now beginning to molt heavily, their combs are as bright and red as at the beginning of the season.

You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably.

Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want it.

Where the local dealer does not keep it, we will make you a **SPECIAL OFFER** to deliver it freight prepaid to any Railroad Station in California, at the following Prices:

10-lb. Package, \$1.50; 25-lb. Package, \$3.25; 50-lb. Package, \$6.00; 100-lb. Package, \$11.00

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW and insure yourself lots of eggs when prices are high.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

A Tenderfoot's Questions.

Coming to this State from the East—where the conditions are so different—will you please give me a little information through the columns of your paper.

First. What is the best mode of training—or form of trellis—for grape vines, berry bushes, etc.; where we have hard winds,—Monterey Co.
Second. What is the best use that can be made of hen manure and wood ashes on home garden, together or separately?

Third. My sweet corn is being destroyed by a light colored, creaseback worm. What can be done to control?

Fourth. I have some fine cabbage, quite solid. In the morning I will find them split open and the leaves cut away from the heart at its base. Is this a disease, or worm, or from rapid growth?

Fifth. Can Bordeaux mixture be bought in dried form ready to add water—if so from whom?—Easterner.

Your first question we will leave unanswered and ask any subscriber with experience to send in any hints his experience may suggest. As a hint, we may say however, that heavy posts (three by four redwoods) say sixteen feet apart in berry row with wires stretched between, works nicely. For grapes, in field culture, for such varieties as are long pruned, a heavy stake two by two with two or three cross arms is often used.

Hen manure can be taken directly to orchard and worked sparingly in soil about trees. Or mixed with equal parts of loam or leaf mold, weeds or straw and composted, in which case gypsum or even road dust

may be used to absorb any escaping ammonia. Ashes are excellent in springtime to scatter about all plants which the cut worms will attack. It then serves the double purpose of fertilizer and a protection from insects. A cut worm sometimes gets hungry enough to crawl through a ring of ashes about a plant, but not often. If you do not care to save to use in this way, ashes may be worked in about rose bushes or other plants at any time and do you excellent service as fertilizer, also in keeping some grubs and ground worms from doing damage. We would not mix manure and ashes.

We assume you refer to the worm which eats its way down into the tips of the ear of corn. The worm is *Heliothis armigera*, and infests cotton as well as corn. In fact, cotton growers protect their crops by planting rows of corn in the field of cotton to lessen the attack on the cotton. This gives you a hint of the only practical remedy. That is, plant a couple of weeks before your regular sweet corn crop is planted, a few rows of field corn to lessen the attacks on your regular crop.

Your split cabbage may possibly be from irregular irrigation or more probably from the variety.

Bordeaux may be had in a condensed liquid form. Simply add cold water and spray. Seed houses advertising in *Cultivator* will supply you.

Lame Colt.

I have a fine young horse that got cut about six weeks ago on a wire. I bathed the wound and bandaged the leg in arnica. The wound has healed but the horse is lame. Please prescribe a treatment.—S.

If there is no swelling, and you do not state there is, and there is no appearance of inflammation, as of proud flesh, bathe the leg for twenty minutes morning and evening with water as hot as you can bear your hand in; wipe dry, then apply a liniment, one part of oil of ariganum and one part aqua ammonia. This will blister after a few applications; cease the use of the liniment till the wound heals, and bathe with the hot water as above directed. We hint in time the soreness will cease. If this remedy does not cure the leg apply to Dr. Oliver the veterinarian on the *Cultivator*.

Constipation.

What is the best remedy for constipation in a horse, asks a correspondent from San Diego county.

Raw linseed oil is the best remedy we know of for constipation in a horse, as it acts quickly and is simpler than almost any other remedy we know of. Half pint to a dose repeated in four hours is ample. By the way, this is an excellent remedy for constipation in cattle as well as horses. We have used it with excellent results.

Pope Leo.

In answer to a query from a Beaumont correspondent, a subscriber at Gaviota writes:

"In your issue of July 25, I note query as to Pope Leo, a stallion. As the horse is owned and at stud near

here, I write for the information the subscriber, that "Pope Leo," thoroughbred, by St. Leonidas, owned by L. P. Talladay, of Olivas."

We thank our Gaviota subscriber for the information.

Durhams—Shorthorns.

Will you kindly tell me the difference between the cows that are commonly called "Durhams" and "Shorthorns?" W. B., Compton.

This question carries us back to the early years of 1800. Much of the history of the early breeders is a matter of dispute, but the following seem to be the oftentimes accepted, find in the latter part of 1700, early in the 1800's in the North east of England, breeds or strains of cattle known as the Durham, Teeswater, the Yorkshire and Holderness. Then, later, after the skill of the breeders had crossed immense breeds of the continent given them the abundant grass of the English meadows the Shorthorn appears. The foundation is said to be Durham largely. Before the of the Shorthorn, Robert Bakewell had developed the Longhorns of the same source. The Collings, Jert and Charles, were the leading breeders among the Shorthorns. It came Bates, Booth and Cruickshank. All of these names are familiar to owners of Shorthorn cattle.

The greatest calamity that ever befell the industry of pedigreed stock came with the ambition and booming of Shorthorn cattle by their breeders. The craze equaled the Holland Tulip, the South Sea bubble or Amalgam Copper bubble, culminated in the at New York Mills of a herd of cattle, so closely in-bred that they were worthless, for fabulous prices. The cattle sold, 109 head, for the sum of \$380,000. One cow sold for \$40,000 and another for \$40,600, the highest price a cow has ever brought. The \$35,000 cow when I was a girl. The regular Shorthorn breeders did not care for milk; it was for beef. Naturally, good milk cows rapidly the quality. Bates stood for the holding of the quality, or the dual purpose idea. Cows that made a record at the Lumbian exhibition, were of the King strain.

The early Durham were fine producers; those brought over by Penn were red and roan, while cattle brought or sent to the Pennsylvania Fathers were of the same type. John Alden bull, known in poetry of the despised white color. The descendants of these cattle are the so-called native cows of Pennsylvania. These red and brindled are good producers. When I was a child I remember that my Uncle, in lower Lancaster county, had a herd of these, bred on the farm my uncle, from cattle placed there by his grandfather. In 1874, ten of the cows were making a hundred pounds of butter a week, after the milk of four calves and all the milk cream used in a family of nine had been taken out. The milk was stored in a cellar and hand skinned and the buttermilk was a rich and delicious drink. These cows received only the grass of the meadows and the running brooks.

We children fed the tiny calves at least the older lad did so while looked on, so I am positive as to the number. There is a record, made in 1824, of a Pennsylvania cow of the ham strain, that produced 20 pounds of butter on grass alone.

20th Century Light Co.

609 E. Seventh St., Los Angeles, Cal.

When writing advertisers, mention *Cultivator*.

The American Shorthorn Breeders' Association was among the earliest, being established in 1842, and now on its 45 volume of herd books. The only breed of cattle originating in the United States that has a herd book is the Polled Durham. These have been bred from the milk-strains of the Longhorns. The type of horns or polled has become a standard type. While they have a herd book, yet, the cattle are recorded also as Shorthorns. An animal is eligible for the Polled herd book on two conditions. Both sexes, if they are of the offspring of registered Shorthorn parents, the female that can show her parents to have given her 98½ per cent. of registered Shorthorn blood.

Speaking of Longhorns the idea must not be taken wrongly to mean that of horns like the Texas steers. Longhorns have a horn that is elegant, hanging down parallel to the faces, sometimes they curl up at the ends and turn into the cow's neck and have to be shortened. I had a cow showing a horn so close to the skull that it pressed in. The horns were as though they had been soft bent down at the very butts. A beautiful and typical Longhorn was recently shown in an illustration in the Breeders' Gazette of a bull that won at the last royal show first premium. M. E. S.

Ship Dogs.

I am anxious to get into communication with one or two persons in California who have for sale Old English sheep dogs and grey African dogs. C. H. W. Lewis, Talmage, Colocino county, Cal.

Hole In Teat.

Will you please tell me how we can stop a hole on a cow's teat? The hole is on the back side of the right back teat, about half way up.—Mrs. E. E. M.

This case cannot be operated on while cow is milking. When dry cut down on opening and clip a little of the duct out. Then bring the edges together with silk stitches and wrap teat up until healed. Don't cut into the main duct in center of teat, only the branch.—Dr. W. J. Oliver.

Sage.

Will you please give me any information that you can, in regard to sage culture here. Which is preferable, spring or fall, to set plants? Is there any home market for sage, in any quantities?—F. M. W., Rialto.

We do not know of any sage grown here commercially. In Illinois and other Eastern States it is somewhat of a feature agriculturally and assume it can be grown cheaper and on cheaper land than in California. It may be planted at any time during the wet season. Would plant cautiously till home market is developed.

Pruning Apricot.

We have a few apricot trees three years old. When and how shall I prune them? We have one apricot tree, which is six years old, and has never borne any fruit. Will you please tell me through your Cultivator what is the matter with it? Mrs. L. M., Petaluma.

Cut your three-year-old apricot trees back to half of this year's growth. This is to make them stocky. If there is much heavy brush, prune all the large side branches off close and leave most of the fine growth. This will give the trees a chance to make good, strong laterals that will hold a heavy load.

Your six-year-old tree must be a poor variety. It is time it was doing business. J. W. M.

Mr. Mills does not say when to prune back as he suggests above, but probably he means the heavy cutting for later in season when trees are dormant, say December and January. We have seen trees like your six-year-olds pruned early in July very heavily give good crops the next year.

Blackleg.

Please give remedy and treatment for blackleg in cattle. It has appeared in this section and is taking off young stock. What is the best preventative and how used? H. C. J., San Luis Obispo.

The treatment is prevention by vaccination. We are constantly sending calves to infected districts. We treat them for the purchasers and have not had them complain of losing any of the animals from blackleg. The virus and needle for using it, with full directions, are sent out by the Cutter Laboratory at Berkeley. While I do not usually give names of firms, this firm has been conscientious in their work and has given reliable virus to the stockmen. A few years ago the market was full of virus that caused many losses. One poor man south of here is said to have lost eight head of cows by an improperly prepared virus.—M. E. S.

Drying Off.

I have a Jersey cow five years old that will be fresh in about a month; has been giving about three quarts of milk until last week. We noticed a clot in it and thought we had better dry her off, so began milking only once a day. The clots have increased rapidly. Is it a natural proceeding? Should we have dried her up before? She seems perfectly well. An early answer will greatly oblige. A. L. Hurtt.

This cow is trying to go dry. Give her a good physic of one pound of Epsom or Glauber salts and a tablespoonful of ginger. Give it with plenty of water to reduce any inflammation. Only milk once a day. It is probably too late to stop milking entirely, but if the milk flow ceases entirely it will be all right. Feed her on light food, grass, green vegetables, leaving off all grain, reduce the hay to a minimum. Before she calves repeat the salts so that all the secretions will be loose. M. E. S.

Turnips for Hogs.

Will you please answer in the Cultivator if turnips are a good feed for hogs? If so, when should they be planted? J. E. H., Santa Fe Springs.

Turnips are little grown for feeding as they are less valuable than other crops that can be produced with less expense. The average turnip contains about ninety per cent water, 1.3 of protein and nearly 5 per cent. of nitrogen free extract. As long as alfalfa grows the pigs in California will "live in clover." As to the time of sowing turnips, not knowing the conditions of moisture with you, I could not advise, but the nearest market gardener will tell you all about the proper culture for the region. M. E. S.

Lady Bugs—Cucumber Beetles.

What will keep lady bugs off of cucumber vines and beans? Also what is good for tomato blight on the vines? H. S. S., Elmira.

Lady bugs are almost invariably insect eaters and are the friends of fruit grower and gardener, so don't discourage them. If, however, you are bothered with cucumber beetle, or diabrotica, with a greenish yellow form with two black stripes on wing cover, pick them off and kill or spray your vines with Paris green or some arsenate mixture, though great care must be observed if the cucumbers are large enough for use. In that case hellebore is your only safe remedy. Use Bordeaux for blight.

Household Department

THERE IS NO UNBELIEF.

There is no unbelief;
Whoever plants a seed beneath the sod
And waits to see it push away the clod,
He trusts in God.

Whoever sees 'neath winter's field of snow,
The silent harvests of the future grow,
God's power must know.

Whoever lies down on his couch to sleep,
Content to lock each sense in slumber deep,
Knows God will keep.

Whoever says "Tomorrow," "The unknown,"
"The future," trusts the power alone
He dares disown.

The heart that looks on when eyelids close
And dares to live when life has only woes,
God's comfort knows.

There is no unbelief;
And day by day, and night unconsciously,
The heart lives by that faith the lips deny,
God knoweth why.
—Edward Bulwer Lytton.

HOW THEY CAME TOGETHER.

WHAT do you charge a dozen for this style of photograph?" asked Lionel Rushmore.

"Five dollars. Here is what we consider a sample of our best work. I intend to put one of them in the show-case outside." And, opening a box, he held out a photograph to Lionel, disclosing the smiling face of a beautiful girl of some twenty summers.

"A beautiful picture!" he said at last, laying it down almost reverently. "You generally print extra copies as specimens, do you not?"

"I would like a copy to show some lady friends," said Lionel, assisted by a sudden inspiration. "I think it might bring you several customers. Will you sell me one? I don't mind the price."

"We have occasionally done so," said the proprietor, hesitating. "I don't know that there is any objection. You may have one for a dollar."

"I have found my ideal in the winning countenance that smiled up at me from that bit of cardboard, and if the original is anywhere in these United States I'll find her and win her, if possible."

At the appointed time Lionel called for his own pictures, and after telling the proprietor that he might expect a number of new customers in a few days, thrust the envelope containing his photographs carelessly into the breast pocket of his coat. Reaching the foot of the stairs, he stopped a few minutes to pull out his handkerchief, and by a careless jerk pulled out the envelope also, which split, sending the cards in all directions.

"Hello! here's a pretty piece of absent-mindedness!" Lionel exclaimed, regarding the duplicates of himself that met his eye; then he gathered them hastily up, failing, however, to notice one that had slid behind an easel supporting a large photograph in the vestibule, and putting them in to another pocket, walked briskly away.

Had he not gotten out of sight so quickly, he might have seen the graceful, girlish figure that turned

in at the photographer's door a moment later.

"My pictures are completed, I suppose," she asked, pausing almost at the very spot where Lionel had so lately stood.

"Yes, ma'am; we have had them a week," and the attendant placed upon the top of the case a dozen counterparts of the picture even then nestling closely against Lionel's heart "Do you like them?"

"Very much." After a brief but critical examination, the young lady took her property and departed. As she reached the foot of the stairs her dress caught on a nail, and in bending down to release it she spied the photograph under the easel. Feminine curiosity prompted her to pick it up and inspect it.

Presently, with a deprecating laugh and flush, she slipped the photograph into her pocket.

"I wonder who the original is. I should like to know him. That is precisely the face I would wish my husband to have! I will keep the picture as a mascot. Perhaps it will bring us together. How I do hope he is not already married!"

But Cupid, dallying in a reprehensible way, permitted several months to pass by without result, until on a certain afternoon Lionel Rushmore took his seat in a train that was to take him temporarily out of the city. He was gazing out of the window when a sweet voice on the opposite side of the aisle attracted his ear, and as he gazed over his heart nearly stopped beating. The original of the photograph he cherished was sitting there, her bright face upraised to that of the gentleman who was arranging her wrap and bag.

"Oh, no, papa; I shall not be afraid to travel alone. It will only be dusk when we reach Stormfield, and Uncle Alfred will be waiting for me with the carryall."

"Very well, dear; goodbye." The gentleman left the car and the train started. Mile after mile they sped on until it grew dark; some of the passengers were dozing, others preparing to leave at the next station, when there sounded a crash, the splitting of timbers, the shriek of escaping steam, the scream of passengers, and—chaos.

Among the first to clear himself from the wreck, happily unhurt, was Lionel Rushmore. Assistants were hurrying to the scene, while the night air rang with the cries of the wounded and one of the forward cars was on fire. As soon as he could locate the car he had occupied, Lionel got to work with the strength and energy of a giant to remove the debris that was piled around it. Presently a voice sounded near him:

"What are you trying to do there, stranger?"

"There is a young lady right under this part of the wreck!" exclaimed Lionel, excitedly. "I recognize her garment down there on the seat!" He caught the end of a stubborn beam once more in his bleeding hands, when the man interposed, setting him quietly but decidedly aside.

Half fainting, Lionel sank upon a pile of debris, while the man set to work with skill and dexterity. Presently he uttered an exclamation of surprise, then called to Lionel:

"Step here, stranger; you never

saw anything prettier in all your life!"

Staggering forward, Lionel looked down into the wreck. The seat opposite Evelyn faced it and was empty. The shock had thrown her on her knees before it, and a large beam had fallen across the backs of the two seats, completely shielding her from harm.

"Saved! saved! thank heaven," Lionel exclaimed. The words penetrated her stupor. With a low, gasping sob she looked up, and the two originals gazed into each other's faces. The shock at beholding the man who had grown so dear to her before her in the flesh, was too great for the moment; and with another cry her head sank down again to the seat.

"There now, she ain't hurt a mite," said the man, answering Lionel's look of horror. "She's borne up like a heroine, and will feel all the better when she comes to again. Stead now, and I'll climb down and haul her up to you. Heaven must have felt especially tender to her to save her by such a miracle!"

Just then a carriage driven at furious pace pulled up beside them, and a man jumped to the ground.

"Is there a lady named Evelyn Sheldon among these passengers?" he asked in an agitated voice.

"Yes, uncle! alive and well! thank heaven!" the girl exclaimed, darting forward into his arms. "Saved through the efforts of the noble friends!" But the trainman was gone, and Lionel alone was there to receive the praise showered upon him.

"Accept my warmest gratitude and blessing, sir! Now come into the carriage with us, and let me take you home for the night. Indeed, I will listen to nothing else!" he persisted, as Lionel attempted to demur, murmured the word "hotel." "Do you think we would consent to part with you until your wounds are dressed?" He pointed to Lionel's bruised and bleeding hands. "You shall go with us and have the best of nursing the most devoted care, as your well-earned due."

It was a day or two before his hands were well, and before he had taken Evelyn's hands in his, to her of his love and asked her to be his wife.

"If I seem presumptuous for a short acquaintance, let this talisman which I have cherished for months plead for me," he added, as, drawing out the photograph, he placed it in her hand.

"Where did you get this?" Evelyn asked, blushing rosy red. And when he had told his story, she blushed rosier still.

"I, too, have a confession to make!" she whispered. How she told it or what immediately followed we need not relate; but when Lionel said goodbye for the last time that day, it was with his arm around her waist and his lips close to hers.

The interview with Mr. Sheldon which transpired on his return to the city was all that could be desired; and the pictures which brought those two people together so long before they actually met, smile down on them either side of the framed marriage certificate that adorns the private boudoir of Evelyn Rushmore's happy home.—Farrers' Tribune.

Lives of great men all remind us. We can make our lives sublime.

Longfellow.

RECIPES.

may live without poetry, music and art, may live without conscience, we may live without heart; may live without friends, and live without books, civilized men cannot live without cooks.

Edward Bulwer Lytton.

Cucumber Sandwiches.

Take cucumbers thin, place them in water, add a little salt to the water, and soak for two hours (changing the water twice). Make thick mayonnaise dressing. Cut the bread very thin, pare off crust, spread the dressing lightly on the bread and put cucumbers between the slices.

Almond Sandwiches.

Put salted almonds fine until a thick paste with mayonnaise spread on thin slices of bread, cut off crust.

Shrimp Sandwiches.

Take ready four triangular pieces

of toasted bread, spread with mayonnaise, cover two of these with lettuce, put a thin layer of chopped cold chicken (white meat) upon the lettuce, over this arrange slices of boiled breakfast bacon, then lettuce and cover this with the other triangles of toast spread with mayonnaise. Trim neatly, arrange on a plate and garnish with lettuce leaves. (These are more in vogue for lunches.)

Pickle Sandwiches.

Spread slices of bread lightly with cream cheese, sprinkle over pickles chopped fine, over these place three or four slices of olives stuffed with red peppers (called pimolas).

Shrimp Sandwiches.

Take half a pint of prepared shrimps, make them into a paste with two ounces of butter, a little salt and a dash of cayenne. Moisten with a little tarragon vinegar; spread the paste upon both slices of bread, press them together; cut in two and serve.

The Personal Neatness Club

This department has been criticised for the name or caption given to the department. That is, "Personal Neatness" is deemed too restrictive. We wish to send in various little things, some not pertaining strictly to personal neatness. In fact, some of the week's are of a different nature. Very well, some one suggest a better name. Any name under which we can gather together and chat of the things which makes us more attractive to our friends, or our homes more homelike, or our work more easily done.

We surely can broaden out so as to include all. So send in your suggestions. Or if you haven't any, send in ask something. Somebody else will furnish an answer. Our query man had an inquiry recently which we could not answer, but it went out to our big family of readers and just one out of the twelve readers gave exactly the information wanted and much needed. It will be nice, however, while you are waiting for information to send in a note of some kind. If you want a comment come up with your suggestions last." If you want the goods for market, bring the coin of this department for exchange.

Anytime, if "Personal Neatness" doesn't suit send a better name.

Individual Wash Cloths.

We were always having scraps of who had such a dirty face as to give such an indication of having been used, to the Turkish wash cloth in the bath room bowl. It usually ended in the small boy being scolded with getting off some of the summer tan" and leaving a very "washed" appearance to the wash cloth. So mother came to the rescue one day, above the bowl appeared two hooks, each with a nice clean Turkish towel—about a square. The first was Daddy's, the son's, then daughter's and last (as usual) mother's.

The family was led out and exhortation given very sedately as to meaning, the rights and privileges with those cloths. Every one was to use his own as he pleased, no other; then wring and return to the book.

It is immaterial which showed that "washed" appearance the quickest,

but that is appearing less and less, hence a good habit is forming.

Now, I want to know: Our water is "hard." After each bath the porcelain tub is gummy and sticky. Lye and scrubbing takes it off, but it is very inconvenient to use. Can any one give me a hint?—Mrs. M. B. C., Pomona.

Warm Weather Suggestions.

Too much stress cannot be laid on cleanliness in the care of the dairy cloths and dish cloths, as a greasy and grimy cloth will make a fine breeding place for disease germs, and it pays to have plenty of cloths so some can be sunning and airing while others are in use.

A good way to get rid of the small red ants is to take some small pieces of coarse sponge and sprinkle sugar in the cavities and place them where the ants run. Once every day, pick up the bits of sponge and drop them in hot water, then dry and fill with sugar and use again, and while this is a very simple it is a very effective remedy.

For excessive perspiration in summer, try bathing with a lotion comprised of one ounce of hydrate of chloral in one pint of soft water and apply with a piece of soft linen, allowing the water to dry on the skin.

An excellent remedy for hay fever—if any of our California readers do not know what is meant by "hay fever" our Kentucky subscriber will enlighten us—and nose colds or any catarrhal affection, is made by dissolving one teaspoonful of borax in a glass of warm water and snuff it into the nose allowing part of it to escape through the mouth. Gargle the throat with the borax water and for a bad case, the spray should be used at intervals of every hour or two.

Weak borax water is also excellent to bathe children in who break out all over with heat, as it stops the itching and removes the feverish condition.

To relieve pain caused by the sting of a wasp, bathe the part with turpentine, and use yellow soap for mosquito bites, and a paste of soda for bee stings.

A good remedy for bowel trouble is to steep the leaves of rag weed and when cool drink freely of the water.

Crushed beets make an excellent healing poultice for cuts and wounds.—H. H., Kentucky.

Grease spots can be removed from wall paper by rubbing gently with soft bread crumbs. Pack the crumbs lightly in a small ball, and work with a rotary motion. If the stain is very obstinate, spread with a paste of potter's clay, water and ox-gall; dry and renew paste until the stain disappears. Wipe down the walls with a clean old pillow case tied over a broom.

In testing a piece of cloth to see if it is a cotton mixture, if you cut a small piece off and put a match to it, if it is all wool it will only singe, but if cotton is there it will flare up.

Another brush fire in the Bear Valley back of Redlands covered a thousand acres in a short time last week.

Citrus Market

LOS ANGELES, Aug. 14, 1907.

There is no change and little interest in the citrus market. All believe the conditions on late fruits will remain practically unchanged until all are dispatched, so that but little concern is manifested. In the Eastern markets the ups and downs prevail according to weather, but on the whole a steady market prevails. Three or four hundred cars will clean up the remainder of Valencia's now in California and will gradually be forwarded during the next six or seven weeks. In words will be fully out of the market for the opening of the new year this is November first.

The sections report early ripening and an outlook for at least an average "About the same as this year" report of some.

Valencias continue to command a good price. Sixty-four cars have been forwarded during the past week.

Citrus Shipments.

Shipments of citrus fruits to date aggregate 26,529 cars, of which 3099 were lemons. Same date last year 24,761 of which 3285 were lemons.

PROFITABLE AGE FOR LAYING

The age to which a hen may be kept and still be profitable as an egg-producer is determined largely by the bird. I have owned hens that were not more than three or four years old that were by no means profitable egg-producers, while others were good layers at five or six years of age. I especially noticed a Brown Leghorn hen which laid eggs from early spring till late fall the summer she was five years old. She did not stop laying more than a week at a time from early spring until fall, and much of the time she laid every day. When considering the age to which a hen is apt to be kept, the cost of raising a hen up to the time she begins to lay should be considered. This cost is distributed over as many years as the hen is kept and it is evident that with a hen kept three years the first cost will be only one-third of the hen kept only one year. Hens cannot be expected to produce eggs a whole year without stopping, and they eat the year round, but a grown hen does not require the careful attention when not laying that a young chick does.—Turf, Farm and Home.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

High-Grade Farm Wagons

GOOD wagons are absolutely necessary on the farm.

Remember that paint may hide a multitude of deficiencies—a lot of poor materials, particularly poor wood stock—and that the well painted but cheap and poorly constructed wagon may not be a bargain at any price. Break-downs are expensive, repairs cause delay, and in the end the cheap wagon will prove a most expensive one. Iron of the best quality; wood stock of desired toughness, thoroughly seasoned, are required for the big loads, rough roads, ruts, slips and slides that try the farm wagon.

The iron and wood must be put together properly to give the greatest durability.

That's not all; this excellence of material and building must be combined with light running qualities to make the completely successful farm wagon.

All these requirements you will find in the International Harvester Company line of farm wagons.

The Weber for more than fifty years has been among the best and most favorably known of America's farm wagons.

The most carefully selected and seasoned materials with superior construction in every part make it suit every condition of wagon service.

The Columbus is a strong, well constructed and durable wagon, such as will well meet the needs of the great army of farm wagon buyers and users.

The Bettendorf is a new and valuable improvement in wagon construction, the front and rear gears being made entirely of pressed steel; therefore, the axles, bolsters and other gear parts are free from swelling, shrinking, rot, etc. Ideal for hot or dry climates.

They are the only steel constructed farm wagon gears on the market. These wagons are built to last. Almost any wagon can be guaranteed for a year, but the point that should always be considered is how many years is the wagon likely to do good service? Think it over. It makes little difference which of these wagons you buy. You will make sure of wagon value and wagon satisfaction in any event. You simply can't buy any thing better at any price.

Call on the local agent or write nearest general agency for illustrated pamphlet, describing the wagon you prefer.

Date Culture in the Southwest

Phoenix Dactylifera

THE name "Phoenix" is that of the fabled bird of Arabia who dwells in the desert. After a life of five or six hundred years, she builds her own funeral pyre, fans it with her wings to die, and from her ashes springs again in all the freshness of youth. A symbol of immortality and of life in the desert, the name lent itself appropriately to the date tree—living quite as long as the mythical bird and springing again and again from soil which could

produce no other form of life. That Phoenix, Arizona, should have the chance to be one of the centers around which the development of date culture is occurring is somewhat of a coincidence.

Of about one hundred and twenty varieties imported and planted and tested by the Department of Agriculture in Arizona, nearly twenty have come into bearing. Some of these are of inferior quality, others give great promise.—[Out West.]

Coulson's Improved Mash Egg Food

**Takes
Less
Feed**

**Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

2 to 60 Horse Power

Here's a Good Word from a Man Who Knows:

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon, free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropico, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,
By E. B. Barry, Manager.

The Measurement of Water

A Miners' Inch and Box to Measure It; Also Tables for Weir Measuring Miners' Inches and Cubic Feet

THE measurement of water is, as a rule, little understood by the irrigator and at the same time it is of much interest. During the past week we received inquiries as to how to measure and we give on this page tables which have been in the Cultivator before, but which have a new worthy of giving them repetition.

Those of our subscribers who do not file the Cultivator, will find this page of value to save it where it may be turned to. Bear in mind that in the last issue of December an illustration will be given which will make the coming months' issues of value. File them.

First, what is a miner's inch?

Miner's Inch.

A miner's inch is peculiar to California, nearly all other sections using cubic feet to express the quantity of water. Here it is a somewhat indefinite term, all engineers not using the same. It is above the center of the aperture by which measurement is made, neither the same for a weir nor in making the computation. This variation makes a difference in measurement of from 1.20 to 1.75 cubic feet per minute per inch. If measurement is made through an aperture two inches wide and of length sufficient to pass the water and it is six inches above the center of the aperture, it would make a six-inch head and give flow of 1.5 cubic feet to each square inch of the open-

Measure An Inch.

For that measurement a box should be constructed, at more or less expense, with an open-made variable as to length, by a sliding stop, shown in the cut of "A Miners' Inch Measuring Box." The lower edge of the aperture shown in the cut should be two inches above the bottom of the measuring box and the plank five inches above the aperture, thus making a six-inch head above the center of the stream. Each square foot of this opening represents a miner's inch, which is equal to a flow of one and one-half cubic feet per minute.

This convenience, however, is seldom at hand, we also give a cut illustrating, the "Weir Measurement," which is so simple that any one may construct and get at least a general idea of the amount of water flowing in a stream. The miner's inch here is usually figured on the basis of four-inch pressure.

The weir should be so placed that the water flowing over it shall be in effect a discharge from the still water of a reservoir and shall not be in the least affected by the velocity of the current flowing into the reservoir or weir box. The velocity of an inflowing current, if noticeable at the weir, becomes a "velocity of approach" which will render inaccurate the desired measurement. This "velocity of approach" may be obviated by placing one or more lattice screens made of laths or other similar construction between the weir and the inlet.

The length of notch should be at least four feet for small quantities, and longer for large quantities. In addition to the above, for accurate measurements it is advisable, if possible, to also have the length of the notch about one-third of the width of the water on the upstream side; it may be necessary to experiment somewhat in order to obtain this condition.

The overfall, or vertical distance, the water falls on the down-stream side, should be about

twice its depth—that is, 12 inches if the notch is six inches deep, and so on.

In the pond not less than three feet, and preferably six feet from the weir and to one side so as to avoid any current, drive a stake, with its top

Weir Dam Measurement

precisely level with the bottom of the notch in the weir; then measure carefully with a rule the depth of water over the top of the stake. This will give the theoretical depth of flow.

The two tables given on this page may be used to determine either the number of miner's inches or the number of cubic feet per minute.

TABLE FOR WIER MEASUREMENT.

Giving Cubic Feet of Water per Minute, that will Flow Over a Wier Once Inch Wide and From 1/8 to 18 3/8 Inches Deep.

INCHES	1/8	1/4	3/8	1/2	5/8	3/4	7/8

A Miner's Inch Measuring Box

Suppose the weir to be 66 inches long, and the depth of water on it to be 11 5/8 inches. Follow down the left hand column of these figures in the table until you come to 11 inches. Then run across the table on a line with the 11, until under 5/8 on top line, and you will find 15.85. This multiplied by 66, the length of the weir, gives 1046.10, the number of cubic feet of water passing per minute.

Table of weir measurement giving miner's inches.

3 3/4	2.43	7 1/2	6.87	12 1/2	14.82	24	39.32

For instance: If the rule indicates a depth of three and one-eighth inches of water, turn to column No. 1 for three and one-eighth inches. Opposite it in column No. 2 is 1.86, which means that for every inch of the weir there is flowing 1.86 inches. If the weir is 36 inches long: $36 \times 1.86 = 66.96$ miners' inches over the weir.

One cubic foot of water equals seven and one-half gallons.

One cubic foot of water equals 62 1/2 pounds.

One cubic foot of water per second equals 50 miners' inches, or, one miners' inch is .02 cubic feet per second.

One miner's inch equals nine gallons per minute, or practically 13,000 gallons each 24 hours.

Nearly every farm has at least a few acres which are of little value for growing agricultural crops. This land should be set aside for a woodlot and devoted to the production of fuel, fence posts, and timber for farm uses.

The species best suited for plantations of these various sorts, as well as planting directions and advice as to protective measures, are subjects which the owners of unimproved lands should acquaint themselves by consulting the best authorities in our national forest bureaus.

It is as impossible to farm in California without a good agriculture paper as it is to do a day's work without first eating a wholesome breakfast. The really good farm paper, whose subject matter is written by those who know, is always filled with suggestions which benefit, and he who reads cannot help but become a good farmer if he follows the suggestions.

Deciduous Fruit Culture

EARLY GRAPES.

A FRIEND has just called our attention to a curious case of early ripening of grapes. A Niagra vine is trained over a window which has a wire screen and has no glass. This opens directly from the house and on that part of the vine which is opposite the window, the grapes ripen two weeks earlier than they do on the balance of the vine. No doubt the warm air which goes from the house out of the window, hastens the ripening in this case. At any rate, the grapes from that part of the vine are ripe and gone while the balance are still green.

AN EXCEPTION.

What seems to be an exception to the rule in pruning grape vines was shown us recently in the Sacramento valley. All scientific grape growers for generations back have advocated pruning to canes which come out of the previous year's growth. This has been the teachings of the university officials and is the only true method to follow. It is almost universally true that grapes bear better where such pruning is done than when sprouts coming from below the crown are used for fruiting wood. Even if the vines bore equally, as well when pruned either way, the ad-

vantage would be in favor of pruning to what is known as fruit wood, that is, canes coming regularly from the previous year's growth. This enables the grower to get trees in a condition for systematic work. It enables the pruner to make a shapely standard and insures a longer life to the vine than when shoots form below the crown are used for fruit wood. The case referred to above was a row of Thompson seedless. It was in the center of a block and was allowed to retain the sucker growth below the crown. This sucker growth known as "bull canes" is producing apparently as many grapes as the fruit canes on the properly pruned vines.

SPRAYED PEACHES.

We recently overheard a conversation between two trucksmen in Fresno. One had just finished hauling peaches from a five-acre orchard near town. This orchard was the only one that had a full crop in the vicinity. Truckman No. 2 asked No. 1 why it was and the answer was that the man with the big crop of peaches had sprayed and the other growers had not. This should serve as a striking example for those who have not been able to see the virtues of spraying.

BUDDING.

August is the month for budding trees and, as numerous requests come to the Colorado Agricultural College for information on this subject, a brief description of the art should be of interest.

All our first fruit trees may be propagated by budding, and old trees are successfully worked over by this method if the young branches are used. This method of propagation is most used, however, in growing nursery stock where seedlings are used for stock which are to be worked over into a desired variety.

The Bud.

The buds are taken from well matured twigs of the current season's growth, and are found just above the base of each leaf stem. When the bud sticks are cut, the leaves should be trimmed off at once, leaving a short piece of the leaf stem, which is to serve as a handle to the bud. They should then be wrapped in moist cloth, so that they will not wilt. The buds are cut from the stick just as they are to be inserted in the stock. A very sharp knife must be used for this purpose. Begin at the lower end of the stick and insert the knife about three-fourths of an inch below the first plump bud. Now, with one clean movement of the knife, cut slightly into the wood and bring the blade under the bud and beyond about three-quarters of an inch to the

surface. We now have the bud moved from the stick and attached a thin piece of bark and wood.

The Cut.

The stock is ready to be budded any time that the bark will slip. This is usually in August, but the season may be greatly varied where we can control the water supply. In seedling stock, the buds are inserted as close to the ground as convenient for tying. A T-shaped cut is made in the stock, usually on the north side; then the bud is cut and inserted. By taking hold of the leaf-stem-handle, the bud may be pushed well down between the bark and wood of the stock where it is firmly held.

Tying.

The last operation is tying. For this purpose the inner bark of a tree is used, which is known to the trader as raffia. The raffia is cut in convenient lengths and kept moist. Begin at the bottom of the cut and wrap upwards, being careful not to cover the bud itself. The raffia should be wrapped tightly, and a sufficient amount used to cover all of the surface. The wrapping is essential in order to keep the parts from drying out.

Cutting String.

In about two weeks the buds will have "taken," or become attached to the wood, when the raffia must be cut. If left too long, the growth

LET US EXPLAIN

to you the difference between the PURE BRED FRANQUETTE WALNUT—as shown on the border of this Ad—and the ordinary English walnut. When you buy walnut trees, BE POSITIVE WHAT YOU ARE GETTING. Guessing is uncertain and often expensive.

Our walnuts for seed purposes and our scions for grafting purposes are all secured from Mrs. E. M. Vrooman's famous GRAFTED FRANQUETTE WALNUT grove of Santa Rosa, California. Her grove contains

ONE THOUSAND TREES---ALL GRAFTED

the only large bearing FRANQUETTE grove of "ALL GRAFTED TREES" in the world. Write for our FREE BOOKLET describing this "King of Walnut Groves" and its record. When you buy trees that are descendants of this grove you make no mistake. We guarantee our trees to be Pure Franquettes.

We cannot tell you much in this small space, but let us write you direct. The Pacific slope—(generally speaking)—is adapted to Walnut culture and is destined to become the center of this profitable branch of horticulture. Why not start now? Address,

tree or limb and is likely to cause wrapping to become very tight, the effect is similar to girdling. The buds should remain dormant the following spring. The stock cut off just above the bud, and operation is complete.

Pruning Over Old Trees.

sometimes pays to bud over trees when the varieties are satisfactory. In order to do this advantageously, the branches should be cut well back, so as to induce a growth of new, vigorous limbs. The following summer these growths should be budded as described above. One may learn to bud successfully, but it requires a great deal of practice before one becomes at all skillful in the art.—W. Paddock.

CANTALOUPE BLIGHT.

The fungus disease that attacks the cantaloupe in nearly every melon growing section of the United States is a serious menace to the industry. Numerous experiments in spraying to control the disease have all proved impracticable, owing to the imperfect results and the expense of such work. Experience has shown that the disease is more apt to develop in rains and heavy dews, or excessive irrigation, consequently well drained soil and good irrigation furrows, with judicious use of water, give better results. But the most encouraging means of avoiding the disease is by crop rotation and the use of disease resistant seed.

In 1903 the Colorado Experiment Station instituted a line of investigation to develop a disease resisting cantaloupe from our irregular Netted variety. Bulletin No. 104, published by the Colorado Experiment Station in 1905, reviews the beginning of this work. In this effort, the element of quality was of first consideration, and the result of each year's progress is most encouraging. In order to test the practical merits, under growing conditions, small quantities of the seed of our rust resisting cantaloupes were grown at a number of the experiment stations in the melon growing States and their reports are flattering as our own.

Selection.

The investigation has emphasized the importance of systematic seed selection in order to develop the essential elements desirable in a cantaloupe. An outline of our system is as follows:

Beginning with the foundation of a select specimens that represent among them the most desirable qualities that can be found, the seed of each of these should be saved separately and a minute description of each melon recorded, and a record number given to each. The seed of each individual specimen should be planted in a plat by itself, so that its inherent tendencies may be noted and the individual merit of any specimen then be seen. The selection of individuals is the key to advance in the work, and the selection of the best for its points of merit is as essential as the qualities of the fruit.

Resistant Plants.

When the presence of a disease is noted, the plat is gone over and any resistant plants are marked; also desirable fruiting qualities, such as sweetness, prolificness, vigor and uniformity of fruit. The individual specimens are selected, records made, their seed saved separately and numbered from the plant that produced them. Near the close of the

season the plats are again noted for disease resistance and of those that reveal the most resistant traits, their seed may then be identified by number, thus a scientific selection of the seed of highest merit can be made that will improve the qualities in proportion as the different points are given consideration. For developing disease resistance we have grown our most resistant plants on the same plat for five consecutive years in order to develop the trait in as adverse conditions as possible, and the results are really wonderful. The rust resistant vines were green and almost free from rust and produced melons of first quality when the adjacent vines were dead and dried up.—Philo K. Blinn.

DECREASED ALMOND AND RAISIN RECEIPTS FROM SPAIN.

Consul D. R. Birch, of Malaga, summarizes the raisin and almond trade of that Spanish district for the past season as follows:

One-third less almonds were marketed to American buyers during the year just closed than were sold in 1905. This was due to the shorter crop and higher selling price.

Although the sales to the United States of muscate raisins fell short by 26,000 boxes, as compared with the previous year, yet the tables show the rather remarkable circumstance that the value of the 1906 sales was \$17,462 in excess of the previous season. Two violent rainstorms in September which destroyed one-half the raisin crop, caused a considerable rise in the selling price, which continually increased as the season advanced.

A gush of bird-song, a patter of dew,
A cloud, and a rainbow's warning,
Suddenly sunshine and perfect blue—
An April day in the morning.

PUMP IRRIGATION

AN I.H.C. ENGINE
WILL GIVE YOU ALL
THE HEAD YOU CAN
TAKE CARE OF

If you have to depend upon the pump for irrigating your land, you must have a powerful engine.

Formerly irrigation on a large scale by pumping was thought to be impracticable. But that was before the days of the I. H. C. engines.

In building engines for irrigation purposes it is necessary for the designers to take into account the fact that water must be raised in quantities, and that frequently it must be raised to a considerable height.

The use of hundreds of I. H. C. engines by practical irrigators is evidence of how well these requirements have been met, and how well the I. H. C. engines are adapted for this special work.

The engines are not only powerful, but they have the two other absolutely necessary requirements:

They do your pumping economically.

They run dependably with practically no attention.

Irrigators of large tracts of land must have an engine that is economical in fuel consumption. The I. H. C. engines have reduced fuel consumption to a very low minimum.

It isn't necessary to keep an extra man to attend to the engine. Only an occasional return to the engine is necessary, or a small boy can give it all the attention required.

If you have a lake or stream below your land, or ditch, just look into the matter and see how well an I. H. C. engine will solve your irrigating problem.

Vertical engines made in 2 and 3-Horse Power.

Horizontal (portable and stationary), in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

CORN.

ECONOMY requires the use of a corn harvester and binder. This delivers the corn tied in bundles that are easily lifted with a fork to the wagon-bed. The binder is a labor-saving tool that should be added to the equipment of every corn grower. There are two styles of corn harvesters, one that requires the corn to be bound by hand, by a man riding on the machine, like the sack sewer on the combined harvester; the other is automatic. Either of these machines or corn harvesters are a saving of money and labor over the old way of cutting and binding by hand. The corn is left in good shape to be fed out after the ears are snapped off as fodder, or to be siloed ears and all.

Corn Stalk Disease.

Another way of harvesting corn is simply to go over the field and gather the ears, leaving the stalks standing. The cattle are then turned from the richer pasture fields into the fields of corn stalks to gather up the stalks and dropped ears of corn. The standing stalks are subjected to the night dews and any showers that come along and become sodden and mouldy. Digestive troubles arise at once and many cattle die from impaction of the rumen or else from bloating. This is the common cause of losses in the river bottom lands of California. There is, however, a trouble that is called "Corn stalk disease" that sometimes is severe in the Middle West. November and December seem to be the months in which the cattle are most affected. The disease is painful, the cattle have an unsteady reeling gait, often have convulsions and partial paralysis. The symptoms of the disease indicate that the poison affects the nervous system, for the lungs congest owing to a weakened heart action, with a further result of paralysis of the hind quarters. The source is thought to be a ptomaine produce by rotting the corn plant caused by excessive moisture.

Whole Corn.

Shelled corn is often fed in the West without grinding; in California the little that is used is in the form of meal. At one time the dairy journals were full of pictures of mills to grind the corn and cobs together. The idea being that the heaviness of the corn was lightened by the cob meal. This is recommended still every now and then by some feeders. I tried it several times but the cows thought it was not particularly good to eat. Whenever a cow does not eat her food up clean, then stop feeding it, for she must eat her grain if she makes returns at the pail. Corn can be fed on the cob to horses and if they are young and have good teeth they seem to relish it as a change.

The Silo.

I wish there were letters of gold to write the word silo in! This is absolutely the one best thing to do with a corn crop, ever bit is saved and every bit makes milk—milk—milk! The cows thrive and grow silky of hair, and mellow of skin when silage is part of their daily feed. I saw fine corn silage at

the Polytechnic school the other day. The odor like that of fresh brewers' grains was there. The smell of silage to the cow, I fancy is like that fresh pleasant odor, when the bread is taken out of the pans, is to us; a hungry odor that makes the mouth water. I have seen the cows when the silo was first opened come up to the corral lowing with the water dripping or drooling from their mouths as they eagerly waited to taste that fresh silage. I have watched them plunge their noses deep into the troughs and stand in rows as their jaws moved rapidly; I have said to them: Is it not good? the answer was merely long breaths and the sound of rapidly moving jaws; too busy to be troubled with silly questions like that. I wonder if Mr. Roosevelt ever stood by a lot of cows if he might come to understand that expression is often more than actual speech, that we can understand any animal if we love it, enough to be able to catch a glimpse of the workings of its thoughts.

Feeding of Silage.

A little caution in feeding silage. It is well to consider that it ferments quickly after taking from the silo. Therefore, it should always be fed outside the barns in open troughs that can be readily swept out. The silage left by the cows should be carried to the outside cattle and yearlings, they will relish it greatly. Silage should not be fed until after milking time as the cows may make the milk taste of it as they breathe off the volatile oils in the stables. The neglect of these simple little precautions has brought silage into disfavor with some of the larger consumers, the condensers. These in some places refuse to receive milk from silage-fed cows. As a rule, the condensers pay the highest price of any of the factories so that it is too bad that careless feeders should bring a cheap and valuable food into disrepute. I expect to hear the same thing at almost any time now, about alfalfa for careless feeding that is even fore fatal to the good flavor of milk than rotten silage can ever become.

Prices Paid.

While it is desirable to receive the advanced prices from the condensers, still it is not always so profitable as it is to receive less from the milk and have a larger quantity to sell produced at a less cost. The dairyman has to be a close figurer if he desires to take all the net profit that belongs to him. High-priced grains fed instead of ensilage and he has only to consider the present cost, but also to consider whether the cows will be as good physically as when the more succulent food is freely used. I believe that the health of cows is best on grass, then on ensilage as this is merely "canned" grass. It is their natural food and they perfectly assimilate it. While man is not a grass-eating animal by nature, yet I do not believe anyone will dispute the fact that they feel better when green vegetables and fruit is a large part of their diet. By actual experiment in testing the milk it has been found that cows eating nine pounds of

CREAM IS MONEY U.S. GETS ALL THE CREAM

Holds World's Record for CLEAN Skimming

Marshfield, Vt., Feb. 2, '07. I bought one of the machines, but after running it a little while I found it was not skimming clean. I had it tested at the creameries here and found it to test 1 per cent, and I could not stand this so exchanged it for one of the U. S. machines, and find that if I had given the other machine away I should have made money by so doing. I like the U. S. very much.

ALMON TUCKER.

The U. S. is also the simplest, strongest, safest separator. Only two parts in the bowl—easy to wash. Gears turn in oil and run surprising easy. Lasts for many years with ordinary care.

Let us tell you ALL about it. It's money in your pocket right away to know.

Just write, "Send me new Catalog No. 28." The pictures tell the story. FREE TO YOU.

SORE SHOULDERS

I would like very much to personally meet a reader of this paper who owns any horses that sore shoulders and tell him about Security Gail Salve. This is impossible so I am going to tell through the paper.

You and I both know that horses working sore shoulders are in pain, and that they can as much work without running down as when they are free from pain. I also know perfectly well Security Gail Salve will cure these shoulders; you do not know it. If you did you would buy of your dealer at once and cure them up. You have no doubt often wished that you knew of something you could rely on. You can rely absolute Security Gail Salve. It will do its work every or if you prefer to try it first I will mail sample can free. Just write for it—it will go on first mail.

Also I want to tell you that Security Anthrax Healer is as good for barb wire cuts as Security Gail Salve is for harness galls. Dealers carry in 25c, 50c and \$1.00 sizes. Use them for your guarantee you perfect satisfaction.

in daily and thirty pounds of ensilage will not decrease in milk production or loss in bodily weight, if the pounds of the grain is taken away and ten pounds of ensilage is put in the place of it.

Cost of Silage.

Ensilage is estimated to cost the farmers \$2.50 a ton, while grain is usually worth from one to two cents a pound. Ten pounds of silage at \$20 a ton costs, therefore, one and a quarter cents, while three pounds of grain costs from three to six cents.—M. E. Sherman.

THE "HORSE DOCTOR."

Writing of the higher standard now maintained in regard to veterinary science, Geo. H. Slover of Colorado Agricultural College says:

The standard of the veterinary science course has purposely been placed very high. The requirements are equal to those of any veterinary school in America. Quality, and not quantity, is to be the motto.

Veterinary science has now assumed an important sphere of usefulness. The days of the horse doctor, whose office is in the corner saloon, are numbered. Formerly veterinary science at its best implied simply the treatment of domesticated animals from the common accidents and ailments for reasons wholly pecuniary and humanitarian. In all the history of the world, there probably has not been furnished such an unhampered field for the exercise of superstition and the practice of charlatanism.

The time has arrived when it is accepted that the veterinarian is an honored citizen in any community, whose profession is recognized as a true science, with importance second to none, as he deals more directly with contagious diseases and their relation to the public health.

The human being represents a large field in development, the practice of the veterinarian is confined to the lower animals, which represent a greater mental development. The diagnosis of disease in the lower animals is much more difficult than the human, as the symptoms are all objective. They silently and patiently endure their pain. True, they are silent,

but silence often speaks louder than words.

The losses in the Orient from the ravages of three or four animal scourges in the past can scarcely be estimated. Our knowledge of these diseases today makes it impossible that such a disaster could ever befall the live stock industry of this or any other country. As yellow fever, cholera and the plague have been mastered as diseases of the human family, in the same way, many of the scourges of the lower animals are now very well understood.

There has been more knowledge with reference to the cause, prevention and cure of diseases gained within the last twenty years than in all the history of the world before; this is largely attributed to the discovery of the germ theory of disease. The great work of the scientists now is to discover the specific cause of disease and to remove it.

It cannot be denied that prophylaxis belongs to the broad field of comparative medicine and that its two branches, human and veterinary, are inseparable. This bond of inseparable usefulness in the protection of the public health has been sealed by the anti-toxin principles of serum therapy. The immunizing of animals against fatal contagious diseases, also the cure of many diseases by the administration of repeated doses of the attenuated virus afford us a glimpse of the possibilities for scientific research in the broad field of medicine.

The new veterinary course at the college will have a large corps of able instructors. It is the purpose to turn out scientific veterinarians. At the same time, the populous countries surrounding Fort Collins will furnish an abundance of clinical material. The municipal milk and meat inspection of the city being under my charge, will furnish practical meat inspection, besides plenty of material for the dissecting room and will be helpful in the work of morbid pathology and milk inspection. The veterinary course certainly has a promising outlook.

Feed the heifer calves well. It fixes the habit of consumption and digestion and develops the digestive organs.

A Great Holstein Cow

The Cultivator is pleased to give this week an engraving of the cow which claims a great record for a high price for a dairy animal. Her former owner writes us regarding her, as follows:

"It may be of interest to the readers of the Cultivator to know some-

each in seven consecutive days. The greater part of these large records having been made during the past winter. 'Ybma 3ds Pledge Clothilde,' a reproduction of whose photograph appears in this paper, was the fifth cow in the world to reach the 30-pound official mark. On account of

thing of what is being accomplished along the line of the development of one of the most popular breeds of dairy cattle, the Holstein-Friesians. A system of advanced registry rules adopted by the Holstein-Friesian Association of America is, without doubt, the greatest source of developing the most useful animal known to man. Without this system the world would never have known, accurately, anything of the possibilities of the Holstein cow. As it is now the whole world may know, through this system of officially conducted tests, the most valuable animal of this great breed of cattle. There are now eight cows of the breed with records of over 30 pounds of butter

her great producing capacity and superior dairy type, Messrs. E. H. Knapp & Son, proprietors of the Greenwood Stock Farm at Fabins, N. Y., received from Mr. D. W. Field of Massachusetts, \$6000 for her. Her official records in full are as follows: At 3 years old, 457.5 lbs. milk, 20.25 lbs. butter in seven days. At 5 years old, 637.20 lbs. milk, 25.17 lbs. butter in 30 days, and 2672.00 lbs. milk, 102.68 lbs. butter in 30 days. At 7 years old (her last winter's record,) 643.9 lbs. milk, 30.38 lbs. butter in 7 days; 2629.3 lbs. milk, 121.34 lbs. butter in 30 days. She has produced during official test over 100 lbs. milk in 24 hours. These various records during several different years prove her to be a very persistent producer."

The Ornamental Garden

EVENING PRIMROSES.

SOME years ago the famous botanist de Vries, of Amsterdam, when in Los Angeles, left, with Miss Elizabeth Day Palmer, instructor in botany in the Los Angeles High School, seed of various evening primroses. Seed from these were later given by Miss Palmer to various students, so that today many are grown about Los Angeles.

Some of these in the garden of the writer have been of such interest that these plants are deemed worthy of particular notice. One feature peculiar is the rapidity with which the flower opens in the evening.

At sunset they begin to unfold, and while one stands before them a few moments, dozens have popped out, as one expressed it, "like the popping of corn." In the morning the sun soon ends the flower's existence, for it never opens again. But dozens—yes, hundreds—of others are ready for opening at evening again.

We have asked Miss Palmer to give some facts regarding these wonderful flowers and she gives us the following statement.

Few Evening Primroses in California.

A few of the new species of Evening Primrose discovered, described and cultivated by Prof. Hugo de Vries of Amsterdam have been introduced into California and are now being sown in the field by the Botanical Department of the University of California for purposes of experimentation.

They are handsome plants with their graceful foliage and large canary-yellow flowers, which open in great clusters as evening comes on. First planted because of their scientific significance, they have quickly become favorites in the garden, because of their beautiful flowers which brighten the evenings of the summer and early autumn months.

"As mutants from their parent species, *Oenothera Lamarckiana*, these several new forms are of equal value, but as horticultural plants some are more desirable than others. The parent species itself has long been a garden favorite in various countries of Europe; in fact, ever since its introduction from America, more than a century ago, and is still used there, as here, for parks and large grounds. Erect, more or less branched, symmetrical, with leaves whose long, narrow blades dwindle gradually in size from the rosette on the ground to the great terminal clusters of flowers, they attract the attention of the artist as well as the botanist and florist. Their flowers call to mind those of the Evening Primrose (*Oenothera Hooker*) that graces the streams and irrigating ditches throughout our State, yet these have the handsomer plant, inasmuch as our native species is decidedly scraggly and its individual leaves small and narrow.

Still Greater Beauty.

But even this *Lamarckiana* is surpassed, as an horticultural form, by its mutant *Oegigas*. In this species not only the leaves are broader and the stems stouter, but the large buds spread themselves into four great, broad petals, that stand out in such proportions that they make a magnificent flower and cluster, perhaps the largest of their race. In a garden where the parent type and several of its mutants grew in close proximity, for purposes of comparison, the flow-

ers of *gigas* were found to be, beyond all question, the handsomest of all.

Lamarckiana's red-nerved mutant (as *Oe. rubrinervis*) has also been described sown in various places, in the wild as well as in private gardens. This is noticeable, as its name implies, because of the conspicuous red hue of its fibers which give a decidedly red color to its stems, leaf-veins, flower-buds and capsules, penetrating even the blades of the petals where the mingling of this red and the yellow form an orange hue. Its flowers are of the size of those of *Lamarckiana*, but a trifle deeper in color, an orange tinge instead of pure canary-yellow. Its foliage is that of the *Oe. biennis* type, the wild Evening Primrose of Western America, and in habit of growth it more closely resembles its parent *Lamarckiana* than our scrawny Californian *Hooker*.

Scientifically Interesting.

Another form, the broad-leaved *Oenothera lata*, which springs yearly from *Lamarckiana* is an attractive plant in the garden where foliage adds a bit of beauty. Horticulturally, this is a fine plant. Scientifically it is interesting; for, its stamens incapable of producing pollen, it must be crossed with some other Evening Primrose in order to make seed; otherwise its race disappears with the death of the individuals of the present generation.

The several species just mentioned grow to the height of two, three or four feet, when ample space in the bed is given them, they often branch profusely and form bushy plants, three to four feet in diameter, their spikes of bright flowers blooming for many successive weeks. From June until October their beds are ablaze every night. True to the customs of their race, they close when the morning's sun becomes too warm; in Southern California sometimes before midday, further north, however, often remaining open until the afternoon.

A Fine Border.

These fine large species that fill the beds so well have a representative that makes a pretty little border-plant. It is a dwarf *Lamarckiana*, (*Oe. nanella*) with its parents foliage and flower reduced in size. Its flower clusters begin to open when the stocky little plant is but five or six inches high and continue until it reaches a foot.

These are the forms that have reached California, a selected few from the dozen (and more) that have appeared from the parent *Lamarckiana* at times during the last few years in Holland. To the scientific man they are of interest as showing Nature at work making new species, and how and when this has been done has been ably recorded by Prof. de Vries (who found them near Hilversum, in Holland, has watched them for more than forty years, and experimented with them since 1886 and in the course of these experiments found them repeatedly giving rise to these new species) in his books, "Die Mutations Theorie" and "Species and Varieties," and in separate articles in various magazines; also by Macdonald in "The Independent," for Sept. 25th, 1902 and "The American Naturalist" 1903; as well as by other writers in Europe and America who have seen these new forms growing and have been delighted with their appearance. —Elizabeth Day Palmer.

"When the outlook is not good, try the uplook."

CONGO THE NEVER-LEAK ROOFING

STOP THAT LEAK

THE rain will damage the contents of the building and ruin the building itself.

A leak in the roof, no matter how small, is a leak in your purse.

The best way to make repairs is to cover the old roof with a new roof Congo.

Congo is easily laid over shingles, or tin, or other ready roofings.

Figure up the cost and you will be astonished how cheaply and easily you can get a tight, durable, weatherproof Congo roof. Nails and cement furnished free.

OR EXCHANGE
A FINE FARM

St. Paul, Minn., for good South-California property. 200 acres fine in the best of condition; large, substantial buildings, including four barns, head cattle and other stock; a large house, and a creamery. Only 11 miles from St. Paul City Hall, center of three of the greatest States, with very best shipping facilities, it is an ideal location for a pure-cattle farm, a money-making dairy, fine home. And it is also adapted for other farming purpose. As the owner has moved here, he will trade for similar ranch in this vicinity, or for Los Angeles or nearby property. I don't want worthless equities or poor stuff usually offered in trade, as I am very busy, please do not mix me with such offers. This farm is worth \$25,000, but \$20,000 cash will be accepted, and any trade must be on a cash basis, so give cash value. For a more valuable property, worth the money, I can put in St. Paul and other Middle West property up to \$10,000 in addition.

TOMATO BLIGHT.

IT IS about this time of the year that the blight of tomatoes is noticeable in the fields. Plants which have made a fairly good growth gradually remain small and ripen prematurely. Other plants die in the earlier stages of growth and, in fact, all sorts of conditions may be seen in the field. This disease is widespread, and the total loss to the growers throughout the State is large.

Investigations in regard to the cause of the blight were begun at the Colorado Agricultural College some time ago and the result of the work points strongly to the following conclusions:

The disease is due to a fungus, which attacks the plants for the most part in the seed bed. This being the case, there can be no remedy for the plant after it is once attacked. This is true, for the reason that the fungus grows on the inside of the plants and evidently enters only the rootlets of young plants. By examining the tissues of a young plant with a microscope, the threads of the fungus may be seen clogging the cells where they interfere with the passage of food material.

At the present time, then, we see no hope of ever being able to combat this blight successfully in the field. But we do hope to find a method of prevention by improving the sanitary condition of the seed beds. With this end in view, we believe it will pay to thoroughly clean and disinfect the frames or flats in which the seeds are planted. This may be done by washing or spraying all of the parts after the dirt and soil have been removed with a strong solution of copper sulphate. Then fresh soil and manure should be procured, which should also be sterilized. This can be best done by steam. This may be done at small cost by fitting up a small system of two-inch iron pipes which are to be placed in the bottom of a bed made for the purpose. Three ten or twelve-foot lengths of pipe will be ample, and small holes must be drilled in them about six inches apart to allow steam to escape. The pipes are now placed parallel to each other and connected at both ends, so that they are about 18 inches apart. The apparatus may be connected to a traction engine or other available source of steam supply. Soil should be filled into the bed over the pipes to the depth of about one foot, then the surface covered with gunny sacks or some similar material. If steam is turned on for an hour, the low organisms will be killed, and plants which will be practically free from blight should be raised in soil which has been treated in this manner.

While the experiments are by no means complete, it is believed that any method which will control this disease must be along the lines suggested. The experiments now under way are being studied, and the results will be reported in due time.—W. Paddock, Colorado Agricultural College.

Get after the moles by setting traps. It is an expensive and tedious process, unless you have the hunting spirit and can make a game of it, but it is the only sure way. Liquid tar poured in their runways will keep them moving, but it doesn't cure the evil.

APHIDE.

As the aphid pest causes damage to the extent of hundreds of thousands of dollars, they are worthy of more than passing comment. In my late reference to them I advised the pulling up of such melon plants as were effected. If the lady bugs are still present this may not be necessary. Usually they are not at this time of the year. My fields seem to have become stocked with the Hippodamia convergens. They seem to be the only ones that give any relief in the hot summer months. In the Coachella valley many thousands were recently introduced. I have not been able to learn with what results. The melon growers of that section will, in my opinion, be compelled to make breeding places for the lady bugs so they will be with the aphide all the year around. We find them on such weeds as pig weed and deadly night shade. Also in corn fields. Every melon grower should plant a few hundred hills of corn. In the fall the corn should be shocked head downward which assures dry shelter for the lady bugs. From my observations here, I deem that the Convergents will be the ones that will do the work in hot, dry places, as they constitute more than ninety per cent of all the lady bugs. While in the cooler spring months there is a fair sprinkling of all sorts, the hippodamia is about the only one that abounds during the summer.—J. C. Ostergard.

RASPBERRIES.

Raspberries have the same habit of growth as the blackberry, but have a more delicate growth, but the same treatment is necessary to ensure success.

It was formerly believed that the raspberry would not succeed in California, but some of the varieties do very well. As the raspberry is the most highly flavored of the berry family, it is always in good demand at high prices and usually the supply is not equal to the demand.

BLACKBERRIES

Although the blackberry season is over, the vines will want attention. If they have been properly suckered and thumb-pruned they will not need much pruning now. Canes that have borne the present season will not grow any more, but will gradually mature their wood and dry up, giving place to young canes which are the fruit bearers for next season. These require topping to make them stocky and throw out side shoots which will be full of fruit the ensuing season. Good treatment now will be apparent later on. Keep the soil moist and well cultivated and your berries will be large and sell readily.

A new company known as the La Habra Vegetable Growers' Association has just completed organization, and unless negotiations which have been pending with the California Vegetable Union are satisfactorily adjusted, will enter the field as independent shippers. The officers are H. E. Hart, president; F. R. Aldrich, secretary; and J. Leuhm, treasurer.—Fullerton News.

The Oxnard Courier says that the bean crop of that section will be rather light, owing to the fact that the early wet season "discombobulated" some of the recognized rules of growth. Certainly the water must have been very wet.

California Horticulturally

NOT SATISFIED WITH SCUTELLISTA.

PROFESSOR Charles Lounsbury, Entomologist of the South African government, to whom we are indebted for the Scutellista cyanea, the parasite of the Black scale, recently visited California and made a tour of the State, investigating in the course of his travels the work of the parasite sent by him. In conversation with him he informed the writer that, while he had received good reports of its work, and seen some evidence of it, he was not satisfied with it. In his country the Black scale is very rare and hard to find and is being kept in check by some parasite. He had believed that the Scutellista was doing all the work, but now thinks that another parasite, which he knows as working on the scale, is perhaps the more important check, and it is his intention to see that California gets a supply of them. He stated that he would not be satisfied until California is as free from the Black scale as is South Africa.

SULPHURING FRUIT.

Consternation has prevailed among the fruit growers over a ruling of the Pure Food Commission, under the Pure Food Law, which practically made the sulphuring of fruit in drying an offense punishable under the law. Should such a ruling prevail, it would practically ruin the dried fruit interests of this State, as nearly all of our fruits are treated to a bleaching bath of sulphur. This is demanded by the public, who purchase what is pleasing to the eye rather than what is palatable. Sulphuring fruit undoubtedly injures it for food purposes, to a greater or less degree, depending upon how much sulphur is deposited on the fruit in the bleaching process, but fruit that is not so processed is not attractive to the eye, as it is dark colored and messy looking and would be rejected by the average housekeeper. With care fruit can be processed and the amount of sulphur used be so small that it is practically harmless for food purposes and very little injured by the process. All these facts have been made plain to the authorities at Washington, with the result that all restrictions have been removed for this season and before another drying season comes around our fruit men will be able to make themselves heard and get the order so modified that they will be allowed to sulphur fruits, provided the sulphur is not used in injurious quantity.

THE IRRIGATION CONGRESS.

Sacramento is making active preparations for taking care of the delegates to the coming Irrigation Congress, which meets in that city on September 2d. It is expected that some 50,000 people will be present during the convention week, as several other events are billed for the same time and the State fair immediately follows. These people will be drawn from all parts of the Union and railroads are making special excursion rates to California for this occasion. The objects to be attained through the efforts of this congress as set forth in the call, are to save the forests, store the floods, reclaim

the deserts and make homes on the land. The coming congress without question, be the most important and the most fully attended any that have ever been held.

SEEDLESS TOMATOES.

An item is going the rounds to the effect that the Agricultural Department has produced a seedless tomato. The absurdity of this is palpable when we know that the tomato is an annual, and has to be produced from seed each year, and a seedless tomato would be the end, for there would be nothing for a new crop to start from. Tomatoes may be produced with few seeds, and in fact, they have been cultivated until there is very much more meat and fewer seeds than there was, but a seedless tomato is impossible.

STANDING BY THE FRUIT GROWERS.

Governor Gillett is showing himself a friend of the fruit growers, and has done all in his power to protect them. In the fight against the White Fly he has shown himself a man of broad views and firm character, and if the new pest of the orange groves does not find its way to the citrus sections of the State, it will be due largely to the governor's action in the matter.

LIME NITRATE.

About three years ago it was announced by a French scientist that lime should be used with nitrate of soda for the following reasons: It was discovered that nitrate of soda rendered both lime and potash available. Also, potash in combination with nitrate moves more freely through the soil than other potash salts and goes to a greater depth. Lime in union with nitrate of soda moves more rapidly through the soil than it does when used alone. Lime also assists in making potash available and the nitrate working with it makes it much more efficient.

When the soil is rich in potash it may be dispensed with when nitrate is used in conjunction with phosphates. Nitrate of soda usually contains some potash and this is often seen in its effect on the crop and credited to the nitrate.

HABIT IN TREES.

It seems absurd to speak about inanimate things as trees having habits, but the same is true. Prof. Bailey, of Cornell University, in one of his lectures, declared that it was well known that if a tree commenced bearing crops every other year it would keep it up through its whole life. We have noted the same thing. Of course the alternate year bears generally gives a good crop, but it does not form the habit in the tree of bearing every year. This, we believe, can be influenced in a degree by proper pruning, feeding of the tree so that the growth is kept up. Never allow the tree to overbear one year and exhaust its vitality so that it has to go over a whole season to recuperate. Different trees have certain habits as to growth, and these habits become inbred and are transmissible, which is easily noticed in many of the freaks that we have. — Coleman's Rural.

As a rule alfalfa produces more than double as many tons per acre, as compared with clover, and is as rich or richer in nutritious properties.

Does this stream of water look good to you? It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago. How many pump users can say this? It shows conclusively that it pays to install good machinery. We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

but do not die, while trees so affected in the south will succumb in two or three years. The appearance of the af- fected trees in both sections is the same to a certain degree.

The White Fly was so thick while in the winged stage in the trees at Marysville that they would cover a persons clothes as though sprinkled with cornmeal while walking among them.

BORDER ROWS OF LEMONS.

We are often asked by strangers on the trains or public highways why lemon trees are so often along the border of orange groves and why these lemons are so frequently yellowish and sickly.

The first part of this question is answered by the fact that not many years ago the Mediterranean lemon occupied the markets and the Cali- fornia lemon was a side issue, only border rows were planted about the more profitable oranges. These rows indicate the approximate value of the two fruits at that time, many of the earlier plantings of lemons were even budded over to Navel and Valencia oranges. The border rows also served to protect the oranges from invaders, experience having shown that the number of oranges that would be stolen varied directly as their nearness to the public roads.

To remedy the impoverished condi- tion of these border trees, to make them bear fewer tree-colored lemons and a larger crop of more desirable ones is now one of the problems be- fore many of the growers, one that is vital to the appearance of the grove and to its productiveness under pres- ent market conditions. Having been planted at the outside of the groves they are poorly situated to receive proper fertilization and irrigation, and above all, proper cultivation, to bring about these results. If they receive water at all it is "held up" in improvised basins about them and more disastrous results generally follow than when they receive no water at all except what they ab- sorb from adjacent rows. I have in mind a number of these rows where every tree is affected with gum dis- ease as a result of this nefarious practice. The nearness of such rows to roads, water systems or boundary lines makes it difficult to give them the careful attention which the re- mainder of the grove receives. Earth thrown up by cultivating the others, or the embankments along water mains on roadways collects about them so that they are often standing in sodded soil which reaches far up the trunks. Thorough growers know well that these conditions are ruinous to the health of the trees and invari- ably produce a yellowish, sickly ap- pearance, impairing the bearing qual- ities and bringing about a scant pro- duction of small and tree-colored fruit, if not the more serious trouble of gum disease.

The remedy of this evil seems to lie in lowering the ground line where necessary, keeping the soil about them soft and well worked through- out the summer months, supplement- ing these, of course, with proper irri- gation and pruning and by humus and plant food in the soil. In short, make them healthy and valuable by the same methods that are applied to the remainder of the grove.—B. J. Jones.

Tools of Accuracy

Tools for the workshop, farm or home must be tools of accuracy. A plane, for instance, to smooth a board properly must have a keen blade, carefully adjusted—its surface must be true and it must fit the hand.

KEEN KUTTER

Tools and Cutlery

are tools of accuracy. Every ounce of weight— every line, every handle, every blade is care- fully adjusted, and tested before leaving the factory. The trademark on each guarantees it to be satisfactory or money refunded.

The name Keen Kutter includes Carpenter's Tools and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass- shears, Rakes, etc. Also Scissors and Shears, Pocket- knives and Table Cutlery.

Sold for nearly 40 years under this mark and motto: "The Recollection of Quality Remains Long After the Price is Forgotten."—E. C. Simmons. Trademark Registered.

ACQUIRED BY THE CULTIVATOR.

The Far Western Bee Keeper which had attained considerable circulation, but could not secure enough advertising clientage to justify its continuance, has suspended publication. Its subscription list passes into the hands of the California Cultivator which will carry out its subscription contracts.

The publisher makes the announcement of the suspension of the paper as follows:

Riverside, Cal., Aug. 14th, 1907.

To the subscribers and friends of the "Far Western Bee Keeper:" It is with sincere regret that I have to announce the suspension, at least for the time being, of the "F.W.B.K." as a separate publication.

The support necessary to keep the thing going was not given, and without it the climbing was too steep.

In accord with the arrangement made with the publishers of the "California Cultivator," that journal will instead be sent to the subscribers of the "F. W. B. K." to fill out the unexpired dates of the latter. In case, however, this should not be agreeable to some, I will promptly send back the money due on subscription if I am so informed or requested.

HENRY E. HORN.

FARMERS' INSTITUTES.

Conductor Neff announces Farmers' Institutes at:

San Miguel, Oct. 21; Santa Maria, Oct. 22-23; Lompoc, Oct. 25-26.

There will also be Institutes at Compton and La Habra at a date in September not yet fixed, probably during the week of September 16-21.

TIME TO GET BUSY.

The Cultivator regrets very much to see any contention arise between the entomological department of the State University and the State Horticultural Commission as to the manner of the work being done to eradicate the White Fly from the districts where it has found lodgment.

A serious condition confronts the fruit growers of this State and it is no time to engender a controversy, or to delay action in eradicating this terrible pest of citrus orchards. Instead of carping criticism there should be harmonious action and unabated vigilance, on the part of the constituted authorities and the fruit growers of the State, to the end that everything possible may be done at the earliest available date, to free California from the impending disaster which awaits it unless the White Fly is effectually stamped out.

It is hard to pull careless and indifferent fruit growers into line to do what should be done and quickly, when all are in harmony. Many of them do not realize the gravity of the situation and, of course, on general principles question the right, or at least the advisability, of the plan of the work which those in charge are following. In this case at Marysville it was with much sacrifice that people destroyed trees of many year's growth, and many of them of great beauty, for the sake of the interest of the State, but when in the face of the sacrifice those who are supposed to know, come in and contend that the work was inefficient and needless, it weakens the hands of those in power to cause such disinfection and future work will suffer by what has been done. The field men in charge of this work at Marysville may not have done their work perfectly. Doubtless, they all see where it could have been done differently and better. They are hardly human if such is not the case, and the easiest thing in this world is to show where some other man has failed. We, of course, are perfect and would have done perfectly the work that others have failed in.

But, in the face of the present calamity, this contention is not only humiliating, but the gravity is such that it is almost sickening. Every one in authority from this time on should uphold the hands of the State Horticultural Commission and the entomological department of the State University in their efforts to save the citrus industry of the State. Let us cut out all useless bickering and get down to strong, hard work to pull our growers together and do what some papers claim never has been done, the wiping out of any pest which has secured so strong a foothold as has the White Fly in California. Let practical hard-headed men be placed in charge of the work and backed by sufficient financial support, and not make this a time for placing inexperienced boys in the field for the sake of their education.

THE VEGETABLE GARDEN.

It seems very certain that we are not to have much reduction in the price of vegetables in California. The fact is, we are not raising enough to keep pace with our increasing population. Vegetables have been higher the past year than formerly and the outlook is not auspicious for any cheaper prices. We must have garden truck for we are not eating as freely of meat as we used to, and the question is, where are we to obtain vegetables for home use, as we do not seem to be raising enough to supply the market, for if we were, prices would not be so stiff. There is an increase in price of about 33 1-3 per cent over the prices of last year.

In this connection let the Cultivator suggest a vegetable garden for every home. Let the flower beds give place to standard vegetables for a year or so, or until we catch up with the "lost cause." Plant onions, peas, potatoes, squash, beets and lettuce where fall flowers now bloom, and after a while we shall be getting some of our vegetables from our own gardens.

The rapid increase in our population, and the cutting up of fields into suburban tracts has been the principal cause for the shortage in vegetables. There will doubtless be the same shortage in the future and consequent high prices as our population in California is growing faster than our vegetable production. All of which is enriching the grower of garden truck.

REPLACE BURNED TREES.

Forest fires are the plague of this State. Every season, about this time, fire sweeps over large areas of land denuding the mountains and foothills of trees, shrubbery and undergrowth, which act as water holders on the watershed, for the protection of cities and towns situated at their base. The annual spring floods, which bring destruction to thousands of homes in the lower-lying fertile valleys and are generally followed by epidemics of serious diseases, would in a great measure be prevented were the slopes covered by forest. Forests regulate the flow of streams, prevent erosion and turbidity and make waste areas beautiful and productive, besides insuring a source of pure water supply. Wherever natural reproduction cannot be depended upon to cover the denuded and burned-over lands of most of these watersheds, tree-planting operations must be undertaken. While the immediate object of this reforestation will be protective, timber crops will eventually be produced which will yield good profits on all such investments.

It is a pleasing fact that in many counties of this State the authorities are providing funds to replant trees burned last year and this. The time is short, only about four months, until the rains may be expected and when that period arrives every county which has suffered from fire ought to go to work to replace the trees burned. We shall find this the only sure way of controlling flood waters which annually do so much damage to our foothill towns.

BIG CROPS PREDICTED.

Statisticians have been collecting data to show what the crops in the wheat and corn sections of the Middle West are going to realize and the result is far more satisfactory than was anticipated a month ago.

While there will be a falling off from last year's returns there is still a healthy showing made in both the standard crops—wheat and corn. There will be no failure as some predicted, for about three-fourths of a corn crop will materialize and almost as large a per cent of wheat will be realized. Of course, higher prices will be received by producers, which will offset the shortage in the grain yield, and farmers will be practically as well off as with a bumper crop.

So we are not to go hungry, nor are we likely to see financial conditions among the farmers of the Middle West any more strenuous than in former years.

After all, the law of supply and demand will regulate the volume of next season's business and we shall go on as we always have, making money and enjoying it, if we so desire.

MORE BRAINS—SMALLER FARMS.

A farmer, writing in an exchange, tells how, by the use of his head with his hands he cleared \$3310 on thirty-nine acres last season. These are the items he gives: Potatoes, \$27; strawberries, \$81; blackberries, \$43; raspberries, \$2; apples, \$164; garden truck, \$302; fat hog, \$1114; pure bred stock hogs, \$22; eggs and poultry, \$218; pure bred poultry, \$112; three colts, \$284; butter, \$201; three bull calves, \$75; two heifers, \$60; home-dressed meat, \$72. Total, \$3310. Regarding his success he writes: "I have tried to use my head while I was trying to farm with my hands. I think if farmers would use their heads more they would be better off."

There is the secret of success, use the head more, save the wear of the body and live longer. Big farms are not necessary where brains are plenty.

We think we have some pretty big farms in California, and so we have, but we have nothing at all compared with some of the farms of Texas and Mexico. For instance, one man Don Luis Terraza, located in the State of Chihuahua, has a ranch which takes the Mexican Central train more than half a day to cross. Don Luis said to own more than 1,000,000 cattle, 100,000 horses, 700,000 sheep and 300,000 calves. More than 1000 cow boys are needed to look after his herds. He has a slaughter house of his own near Chihuahua city, at which more than 250,000 head of cattle and as many or more sheep and hogs are slaughtered every year. He owns his own refrigerator cars in which his packed meat are shipped all over that republic. Over 40,000 people dwell on this landlord's estate.

News of Country Life in the Golden West

Southern California

Northern California

AGRICULTURE.

beet harvest has begun at Oxnard.

Chino sugar campaign begins August 26th.

These are busy days at Buaro in Orange County with the hay balers.

Hard sugar factory began its season on sugar beets about the 1st.

Imperial Valley farmers are already turning the ground for the coming crops.

Is in Oxnard are reported rather but running to a high percentage of sugar.

Olive Milling Company of Orange County had an annual output of \$200,000.

Alamitos sugar factory has laid up a thousand acres for next year's output of beets.

A severe fire spread over the San Joaquin forest reserve last week burning much pine and cedar.

Highlands people are putting on a storm ditch to care for the coming season's storm water.

Imperial county has become a fact in the election of August 6th and Centro is to be the county seat.

Riverside poultry woman has a Minorca hen which produces an egg weighing one-quarter of a pound.

Fire in the San Jose hills between Santa Clara and Pomona destroyed much valuable pasture and some hay last week.

Over 500 eighty-pound milk cans or carloads are picked up daily between Buena Park and the city of Los Angeles.

The resurvey of the Imperial Valley will be begun in a short time. The survey will cover over one-half million acres.

The denatured alcohol plant which was wished for by Oxnard, Santa Clara and Ventura has finally been located at Ventura.

San Jacinto has been granted by the supervisors of that county a petition for the formation of the San Jacinto levee district.

First sugar of this season's manufacture was delivered in Los Angeles a week from the Pacific Sugar Co. at Visalia.

Coachella Valley promises an increasing acreage of cabbage and melons for next year. Planting will begin in about one month.

Madena sewer farm consisting largely of walnuts and alfalfa has proved very profitable to the city of Madena during the past year.

A number of Brawley farmers are making a new departure and entering into planting of potatoes which is claimed will prove a paying crop.

\$50,000 wheat sale is reported to Colton grain and Milling Company this week. This is the largest sale reported in Southern California this season.

The tangle in the survey of Imperial Valley lands will, it is feared, cause only settlers on 25 sections of State school lands great inconvenience, if not loss.

The cabbage growers of La Habra claim that H. E. Huntington is stepping into the breach in the marketing of cabbages and give the grower relief.

HORTICULTURE.

Covina is busily engaged fumigating orange trees.

Covina will be shipping Valencias until October 1st.

Redlands is contemplating improving its storm drain system.

Santa Ana apricot dryers are refusing to sell apricots, except at good full quotations.

Santa Ana orange growers are constructing a new sweat house for the curing of lemons.

The last car of oranges of the season has been shipped from the Redlands packing houses.

A planter at Redlands contemplates putting out 100,000 young Eucalyptus trees the coming season.

Thirty millions of dollars is the total income to Southern California from her orange crop this year.

Thousands of forest trees have been planted in the ranges back of San Bernardino during the past year.

The Brawley Cantaloupe Growers' Association averaged \$2.42 for standard crates for the season to its members.

Some citrus sections of Southern California are claiming that the white fly will not exist in their community.

The Supervisors of Riverside are making war upon the telephone and telegraph companies for "butchering" shade trees.

Fumigating has begun in Glendora and of her 3000 acres of oranges it is claimed one-half will be treated with cyanide gas this fall.

Dunn & Co. report dried fruit market "nothing doing." Eastern buyers maintaining that the Californians are holding everything too high.

Arnold V. Stubenrauch, expert pomologist working under the direction of G. Harold Powell, is investigating fruit conditions at Riverside.

The orange wrapping machine which is being installed in Redlands packing-house is said to be doing some exceptionally satisfactory work.

The Santa Fe will soon build a large pre-cooling plant between Colton and San Bernardino, which will have a capacity of one hundred cars daily.

Glendora citrus packing-house closed on Tuesday of last week. It shipped during the season 290,000 boxes of oranges of which 42,000 were Valencias.

Prof. Russel S. Woglum, special agent of the United States Bureau of Entomology, is in Southern California investigating fumigation, especially various qualities of cyanide.

"Nothing that has transpired in the last twenty-five years has been so fraught with good to the fruit growers as the pre-cooling process and plant," is the way the San Bernardino Sun Expresses it.

The annual meeting of the stock growers of the Covina Orange Growers' Association was held August 3d, at which the following were elected directors: L. L. Ratekin, H. M. Houser, A. R. Evans, B. L. King, Geo. B. Scofield, C. E. Daniels and C. C. Cady.

Another meeting of the dried fruit growers of Ventura county was held in Ventura last Saturday. The report was received from Judge Daly regarding the meeting at which Secy. Wilson spoke in San Francisco. Steps to take regarding fruit drying were also discussed.

AGRICULTURE.

A big creamery is promised at Chico.

Siskiyou county is promised a new creamery.

Mountain View is infested with chicken thieves.

Hop picking is in progress in all the hop centers.

Yolo county is also getting her share of the army worm.

Turlock Fair is to be held on September 18th to 20th.

Laton is shipping sugar beets to the factory at Visalia.

Farmers near Tulare are putting in new improved telephone lines.

"Hop pickers wanted" is the head of an ad in the Ukiah Times.

Another fierce mountain fire occurred last week in Tehachapi Pass.

Northern papers report the presence of much contagious abortion in dairies.

One thousand acres of the Gianella ranch near Nord have been planted to alfalfa.

California will produce 90,000 bales of hops this season against 110,000 last year.

The total wheat yield of the State will be twenty to thirty per cent short of last year.

San Jose city council is to place a 3.5 per cent fat requirement on milk sold in that city.

Tehama county will exhibit at the coming State Fair and compete for the big cash prizes.

The case of Texas fever which was reported from San Juan is found to be some other disease.

Stockton flour mills are short on wheat and are shipping in from Washington and Oregon.

San Joaquin county had a coyote drive recently, but a very small number of coyotes were rounded up.

A meeting of creamery men was held in Hotel Artesia at Hanford recently to discuss creamery matters.

The Alpine Evaporated Cream Company at Hollister is making preparations to sterilize and bottle goat's milk.

One hundred and five cows were barbed wire alive at the dairy barns of W. M. Luis near Navato in a fire last week.

"Rain-maker" Hatfield seems to be finding some of the "easy marks" in Oregon and the northern part of this State.

The fourth annual meeting of the California Live Stock Association will be held in Sacramento September 11th and 12th.

Santa Clara county is to have a U. S. Government Station for the study of insect life. Dudley Moutton will be in charge.

Enough timber has been grown in the hills of San Cruz county so that a lumber mill has been erected back of Watsonville.

A meeting of owners of land now under water in Tulare Lake was held in Hanford August 17th to discuss plans of reclamation.

Irrigators in the Modesto-Turlock ditches are up in arms over the effort of San Francisco to secure some of their water for that city.

HORTICULTURE.

Prune packing is in full swing at Healdsburg.

The East Side section of Turlock is longing for irrigation.

The Exeter Sun reports their fruit prospects the brightest ever.

Chico reported early dropping of prematurely ripened prunes.

Monterey county is planning for an exhibit at the State Fair.

Some of Pajaro valley apples are booked for shipment to Australia.

Winters cannery is busy putting up thirteen thousand cases of peaches.

Hanford has a fine bunch of fruit in jars ready for exhibit at the State Fair.

The Fresno Republican reports the raisin outlook one of the brightest ever.

Turlock's first carload of green grapes brought \$2900 or \$1.15 per crate.

Turlock Produce Company is shipping table grapes to Eastern markets by the car.

The Winters cannery is a busy place, employing at this time one hundred and fifty hands.

Work has begun on a new raisin packing plant to be a fine fire proof structure at Fresno.

An effort is being made to gather together fruit men in the Fruit Protective Association of California.

Mark Bassett, at Hanford, gathered from one hundred and forty Tuscan cling trees thirty tons of fine fruit.

A fruit grower of Kingsburg has begun suit against the Consolidated Canal Co. for nearly \$4,000 damage from seeping water.

Pear blight is still ravaging some sections. One orchard in Woodland is said to be so badly affected that it will be dug up.

Another experimenter at Fresno has determined that two pounds of sulphur is required to a thousand pounds of green peaches.

The fall crop of the deadly army worm is attacking the vineyards of San Joaquin county, and have already done much harm.

A manager of a big vineyard near Fresno says he would pay a bonus of ten to fifteen per cent for Chinese labor as against Japanese.

Prof. Wickson has been asked by Secretary Wilson to co-operate in determining the minimum amount of sulphur to be used in drying fruit.

Fruit growers at Lindsay are making strenuous efforts by insisting upon new orchard boxes being used so as to prevent the White Fly infection.

Disputes are common between dried fruit packers and buyers and the producers regarding the fulfilling of the contracts under the pure food ruling.

Forest rangers in the north are taking strong hands in the matter of subduing forest fires and anyone refusing to aid in fighting the fire is promptly arrested.

The management of the National Irrigation Congress show that information is received showing that special train loads of delegates are booked to arrive at that great congress to open September 2nd.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed management, disease and its prevention will be answered through these columns.

BREAKFAST CHICKENS.

WE note that some of the Eastern papers are advising the raising of "Breakfast Chickens" as a means of added profit to the poultry business. The scheme certainly "looks good" to the writer for breeders of Leghorns, California's favorite fowl. With the large hotels of San Francisco, San Jose, Santa Barbara, Los Angeles, Pasadena and San Diego as a probable market for this class of birds we believe it could be made a source of profit to the Leghorns and breeders of the other smaller varieties and serve as an outlet for their surplus cockerels, at an age and at a time when the poultry business is generally dull.

One thing that made us think of the "Breakfast Chickens" was a visit to a ranch of a breeder of White Leghorns where over 2000 laying hens are kept. That, of course, necessitates the hatching of many birds each season and the cockerels had to be disposed of early in order that the room might be used for the proper care and development of the pullets. We asked at what age and at what price the cockerels were sold and found that they were sold when about the size of a quail and that they only brought about actual cost. But as it was one part of the business that could not be avoided it seemed necessary to handle this part of the business at cost, or even at a loss, that the profit might be made on the pullets.

In one of the Eastern papers a writer advises that the chickens be hatched in July or August and forced all that they would stand until they weigh about three-fourths to one pound, or, about the size of quail. At this size broiled and served on toast for breakfast, the same as quail. We quote the following from the Successful Poultry Journal:

"My idea is that for some poultry breeders that have the time to go to some good hotel or restaurant and get them to introduce breakfast chickens as a novelty, and I believe they would be quite a fad. Setting these hens the last of July or in August or September brings the chickens on at a time when we formerly had game, such as wild ducks, quail and prairie chicken, but game of all kinds is getting so scarce that it is time to get something to take its place.

"Breakfast chickens must be hatched from some small breed of fowl, such as the Leghorns or Hamburgs. I hatch out a few settings of White Leghorns every year now for my own use, and what I do not use myself have been able to sell at a good price to people whom I have told how to use them, and I think I would be able to work up a good paying business if I had the time.

Of course, you might say that they could or would use these chickens all the year, and so they might, and they could also be served for dinner or supper the same as quail, but I think if breeders would make an effort to put them on the market in September, October and November, and make the chickens good, the public would in a short time expect

them in season the same as they turkeys on Thanksgiving. The chickens should be marketed three-quarters to one pound weight, as they get too heavy to be as one order when they weight in and a person eating one has the satisfaction of choosing the part like best, and they are not too large for any one with an ordinary appetite to eat a whole one. I do not think they should be sold by the pound but by the dozen, the same as game. I was able to sell them last fall \$4.00 per dozen, and they are young that there is a good profit in them at that price. I may be more fortunate than some in living so close to Chicago and having private customers that are willing to take them at the price.

"Of course, my idea may not be worth anything, but those breakfast chickens do appeal to me, especially when they are before me on the table, and I think they would to the general public if they knew about them. We called them "Mock Quail," which I think would make a good name for them. If any one saw a nice bunch of Brown Leghorns hanging up before a market or displayed in a restaurant, the same as game, I believe they would want to try an order.

"They can be served in different ways. My mother used to stuff and bake them for dinner, and it is quite a pleasure to carve a chicken and able to eat it. It also makes the happy, as he does not have to do carving for the whole company. I think this would make the small breeds of fowls more popular and fanciers would be able to realize more money for chickens if they could be placed before the public in this manner.

"We have heard of milk-fed chickens, but all of us do not know to what a great extent the demand for them has increased; it is something enormous, and has been accomplished by advertising, and by one firm in Chicago, and there are so many poultry breeders that if every one will do a little I think it would amount to more than milk-fed 'ads' by a firm.

"Any kind of a chicken that weighs one-half to one pound will do; that is, the small culls that are sorted out of chickens shipped to market. These breakfast chickens must be carefully fed and made good and then they will fill the bill and bring the price the same as yearling cattle or baby beef, as it is called, the live stock business.

"There is no salesman that can sell a common grass Texas steer or prime corn-fed yearlings; the butcher in the market can not palm it off for anyone can tell the difference and so can anyone tell a prize chicken handled the way I suggest from a common cull, and you can also tell the difference when it is placed before you on the table."

We believe if some enterprising poultrymen would take hold of this and give it a thorough test, they will find a ready market, not only in the fall but the entire year.

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

the Australian egg-laying con-
which closed last April, two
s of White Wyandottes, known as
"White-all" strain and one pen
the Victorian competition ending
same date, made a record for the
of 228½ eggs per hen. This cer-
ly is a good record and one of
ch Mr. Huges should be proud.

Mediterraneans for Eggs.

ve want to start an egg ranch.
Which breed would you suggest, the
merican or Mediterranean?

When egg-production alone is de-
sired, the Mediterranean varieties,
especially the Leghorns, take the
lead in California.

have a valuable rooster which is
rapidly becoming blind; a white,
easy growth first appeared in one
pen, and now has attacked the other.
Ralph Henderson, Elsinore.

Our bird has one form of roup;
very often when the nostrils are
closed this substance forms in the
nostrils. Treatment: Clean out nostrils
by pressing thumb nail against side
of forcing out puss; then wash head
with Germozone, full strength, or
eucalyptus oil each morning and
continue until head is better.

Limber Neck.

ve have recently lost several hens
to us, a new trouble. Patient lets
head fall forward to the ground;
seems to lack power to raise it.
Takes no interest in anything and
dies in six to twelve hours after first
noticed. Would the feeding of too

much fresh meat raw or cooked
cause such trouble?—Mrs. E. C. C.,
Buena Park.

Your birds have limber neck caused
by eating decayed meat or maggots.
It is also caused by hot weather, but
we believe if you will look closely
you can locate the trouble. Treat-
ment: Put in drinking water one
teaspoonful of hyposulphite of soda
to each quart of water. When trou-
ble is first discovered give one asa-
foetida pill the size of a pea.

Roosting in Trees.

Kindly inform me through the col-
umns of your valuable paper whether
it is advisable to allow chickens to
roost in orange trees, or would they
be more liable to contract colds and
roup during the rainy season.

Where can I procure the book
entitled "Poultry West of the Rock-
ies?"—J. D. M., Ontario.

We would not object to having our
chickens roost in orange trees until
the rainy season begins, but after the
cool days and wet weather set in they
will do better in the houses. We have
never considered an orange or lemon
grove an ideal place for poultry, es-
pecially in winter, as there is too
much shade, and after the oranges be-
gin to drop the chickens will eat too
much of the soured and fermented
fruit. We have noticed that if we
have a sick bird, especially one with
cold or roup, it will stand around in
the shade when it should be in the
sunshine.

You can get the book, "Poultry
West of the Rockies," of Henry Al-
bers Co., of Los Angeles.

AN ENGLISH BREEDER ON PROF-
ITABLE TURKEYS.

I have this season experimented
with the Bronze variety, putting a
setting in my Cyphers incubator, and
when they had been in a week I
added sufficient warmed hen's eggs
to fill the 60-egg machine. I kept
the temperature steadily at 103 de-
grees during the entire hatch and in
due time hatched nine out of twelve
turkeys. When these were dry I
placed them with the chicks in a
warm brooder, placing a little dry
chick feed and grit in pans in the
warm chamber and leaving them to
themselves for twenty-four hours. I
then got them into the run of the
brooder and have used ground oats,
barley meal middlings and meat meal
mixed to a crumbly state four times
a day, occasionally giving them well
boiled dry chick feed and also rice as
a change with oatmeal. This brooder
is enclosed in a grass run about forty
feet square. They are now four
weeks old. I lost one the second
day which was weakly at the start.
They seem to be doing very well so
far and feed with the chickens quite
contentedly. I am informed by Mr.
George of Marksdanes, Bruton, Som-
erset, England, that he always
hatches all his turkeys in incubators,
rearing them in brooders and finding
no difficulty in rearing them what-
ever.

This may interest some of your
readers and is certainly worth a
trial. I also give them once a week
a small dose of cholera cure, as they
are rather liable to scours reared in
this way. Plenty of grit and clean
water of course. They appear per-
fectly strong and are growing well.
The critical time will be when they
shoot the red at about eight weeks
old I suppose, but I have every hope
of rearing them.—Poultry.

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down
and out of condition. They need to be fed a scientifically balanced ra-
tion during this trying season. EGG-MORE is just the thing to mix with good
grains to make the same a rightly balanced ration. Many so-called "poultry
foods" and "egg makers" are nothing but stimulants and not advisable to be
fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is
very easy to mix a lot of ingredients, much of it a little better than refuse and
call it egg food. And even if good foods are mixed it doesn't make an egg
food unless the ingredients are adapted to the requirements. Some mixers of
"egg food" seem to think that it is the shell alone that is to be made, forget-
ting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with
ground grains, or even with bran, is just what is needed to make her molt
quickly and then lay lots of eggs. It is made of just such first-class materials
and in such proportions as has been proven by long practical experience to
serve this purpose, and at the same time to build up her system and keep her
in the best of health. When a small quantity is mixed with good grains, or
bran, as directed in each package, it can be fed either as a mash or as dry
feed. The hens like it, they eat it, there is no waste; it makes the cheapest
egg food that can be made, especially if you can buy your grains at home
cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb.
sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will
not get it for you, we will deliver a pail or sack, freight prepaid by us.

Bees and Their Care

GENTLE BEES.

PROFESSOR H. A. Surface of the Pennsylvania College says that "there are points in favor of this new imported Caucasian bee, one of which is the tendency to cling to the comb when the frames are lifted from the hives, not flying around in an excited manner as do the bees of some other races. It is a remarkably gentle bee, more so than the most gentle Italian, and is very prolific. Because of its marked gentleness the Caucasian bee is often known as the "stingless" bee. This is not because they are not provided with a sting, but because they do not often care to use that weapon. They are fairly good honey gatherers, and will prove to be valuable in the development of an ideal race or strain of bees.

The Cyprian bee, although far from cross in disposition, is more of a hustler in gathering honey from flowers when there is not an abundance of vegetation in bloom. Therefore, in my opinion the ideal bee for both gentleness and honey producing will be a cross between a Caucasian drone and the Cyprian queen.

It is said by such experts as Prof. Benton of the United States apiary that the bees inherit from the drones (males) the gentleness and from the queens (females) the energy. This would make the Caucasian-Cyprian cross as ideal a bee as can be produced. The disposition of bees, however, depends to a great extent on their keeper and the way they are handled. If the bees are jarred, or where the hive is opened without smoke, as a rule they are liable to become quite cross. Whenever a hive is examined a puff of smoke should be blown into it and they should not be jarred or banged any more than is necessary. Beekeeping is not attended, however, with as much danger as many people suppose if it is done with precaution.

A GOOD WAX PRESS.

To use a wash boiler to melt wax in is sure to raise trouble between a man and his housekeeper; for a woman who attempts to wash, using a boiler that has previously been used for wax melting, is sure to lose her temper if not her religion, for it is no easy job to clean one after being once coated with wax and slumgum; and why use a boiler at all when a square box of galvanized iron is just as cheap, much better, and can be used on a brick furnace outdoors to good advantage, while a boiler could not? About 30 bricks and two joints of stovepipe will make the furnace; and when not in use all can be packed away in some shed out of sight. Not over half an hour is time enough to make it complete; and any one with a town lot has room enough, and there is no mussing of floors to vex the good woman; and the square tank has advantages over the round one of being easier to skim—that is, if you use a square dipper, as you ought to. If you ever used a square one you could readily see the advantage of it. A five-cent cake tin is better than a round dipper.

I have two small tanks—one 15x15 inches and 15 inches deep; the other 18 inches in dimensions, writes C. A. Hatch, in Bee Culture. A 14-inch one made of heavy galvanized iron would last a lifetime if cared for. A dipper should be about 6x6x4 deep, and have a flat handle, rather short

and bent to a hook, so as to hang on the edge of the tank inside when not in use.

Another mistake that is often made is putting too much comb in the boiler at once. Just enough for one pressing at a time is enough, and when you are pressing it out your helper puts in another batch, fires up, and attends to the melted wax; or, if you are working alone, it will do no harm to let the press stand while you fill up for the next pressing.

Dipping the follower and rim into the boiler is just as well as to pour that painful of water into the press and much less bother.

I usually put in about four gallons of water and slumgum at each pressing; but this means an indefinite quantity, for I may get more water than you do. Plenty of hot water is my motto, for beeswax seems to like to run out with water when it will hardly move with pressure. I use an old square five-gallon can to catch the wax in. When the wax is deep enough to warrant it, I skim it off (with a square dipper, mind you) into small tins to cool. These are kept covered as much as possible. With this method the water can be returned to the boiler before it gets much cooler and the wax is ready for market with a little scraping at the bottom; and even this can be largely avoided by extra care in skimming when putting into the cooling tins. The wax may need to be washed, as the water in the boiler gets rather "rich" in coloring before many hours' run.

There is one point that should be impressed on all beekeepers—I, e., that all heating and boiling of wax after being once melted is to its detriment; also that iron rust turns wax black.

BEE KEEPING IN CALIFORNIA.

What can one hope to gain net per colony, in case of intelligent management? I am glad that he added the last, as very much depends here, as elsewhere, upon the energy and skill that one gives to the business, writes Professor A. J. Cook, in American Bee Journal. I know of an able beekeeper who has kept bees here many years and his record is about 75 pounds of honey per colony per year. As he has averaged about six cents per pound for his honey, it is easy to compute what he has secured. Some years the profits are very great—greater than anywhere else I know of in the world. But over against this we must remember that not infrequently because of slight rainfall there are no profits at all; and sometimes such seasons are not single, though I have never known but two failures to come in succession and one of these was not absolute. The worst is not yet, though, for in these seasons of greatest honey dearth, the bees must be fed, and so there is not only no gain, but absolute loss.

They asked if it would be better to engage with some beekeeper for a year and take what he might be able to get for his service, or buy a few colonies and commence at once "on his own hook." Without doubt he would learn faster by the first method and perhaps would be as rich at the end of the year, but there is great pleasure in working the thing out for one's self, and by thoroughly reading the best bee books and taking one or

two good bee papers he might hope, certainly after visiting one or two good apiaries, and observing carefully the work of the bees—to get on without making any very serious blunder, especially if he had some beekeeper near by with whom to counsel in case required.

These friends wished also to know how many colonies I should advise them to purchase in case they concluded to go ahead at once. I answered ten, and certainly not more than twenty.

I was also asked to give the probable expense, kind of hive and location that I would advise. I replied that I had known good colonies in desirable hives to be purchased at \$1.00 each, and that I did not think that one ought to be obliged to pay much more than that for good, strong colonies. I urged that he take special pains to see that there was no fowl brood in the colonies purchased.

In case one works only for increase the other expenses need not be great for the first year. A good smoker, bee hat and other necessary implements are not expensive and, besides these, there would be little else to the hives.

I also strongly recommend that one adopt the Langstroth hive, with Langstroth frame; not that they were necessarily any better than some of the other hives, but they are doubtless as good, and being more used have more to recommend them than any other hive that I know of.

As to location, I made only two points. One is, care to be in the midst of good forage; and, second, be as far from other beekeepers as possible, though this last is not so important in California as in other sections. When we have good honey seasons there is so much nectar that we find bees will do well even though somewhat crowded. I should wish to have an abundance of sage (black and white,) and should like to have these not only on the plains and mesas, but should like to have them extend well up into the canyons, in the honey season, always long before the might be further extended. It is a very desirable to be in the region of large orchards, for the nectar from such source is always valuable stimulation if not for market.

BEES HAVE EARS.

Some scientists assert that bees have no ears and do not hear, but person has handled bees for any length of time without being thoroughly convinced that bees can and do hear readily. Bees have certain signs which seem to be understood quickly by every bee within a hive. The hum of fear, that of anger and of satisfaction seems to be fully understood by every bee in the hive. Did you ever notice at swarming time that when the queen has gone into the hive the quick hum of satisfaction is up and how the bees fall over another in their haste to enter the hive? During times of great fear starvation the deep, deep uttered by the queens seems to be understood by every bee.

A DOLLAR A MONTH.

The Cultivator has no thought of raising its subscription price to \$1.00 per year, but here is one subscriber estimate given when he remitted: cannot do without the Cultivator even if it should cost \$1.00 per month." J. H. Harman, Chino.

General Agriculture

PASPALUM GRASS.

Harrison writes the Cultivator, from New South Wales, regarding Paspalum grass, which is of great value to stockmen in Australia. Of the grass he says: "This celebrated grass Mr. W. S. Campbell, Director of Agriculture, N. S. W., says: 'This grass has attained remarkable prominence, and so many people have become acquainted with its great value, and so much has been written about its merits, that nothing one can write upon the subject seems superfluous.' He also says, speaking of its introduction: 'Gradually the farmers took to planting it, as its excellent qualities became known the demand for seed and plants became enormous, and its name has become familiar to every man, woman and child, not only in the Diamond and Tweed River districts, but all over the coastal districts of the State.'"

Favorite Grass.
This is the favorite grass with the stock owners here, and to the dairy-keepers especially has proved a veritable mine. It produces an immense amount of succulent herbage, which is highly relished by all stock; grows from five feet to ten feet high; bears a large quantity of seed, which can easily be disposed of at a good price, and thrives well almost anywhere. No other grass can equal it for rapid growth, quantity and quality of herbage, and its adaptability to almost any soil or climate; and the person who introduces this grass into his district proves a benefactor, not only to the district in which he resides, but the country generally. Any land on which Paspalum is established is worth from \$50 to \$100 per acre in Australia.

This is what Mr. C. F. Julius, Secretary of the Dairymen's Union, Bucca Creek, in the Government Agricultural Station, N.S.W.: "This remarkable grass is quickly coming to the fore as a grass peculiarly adapted to our uncertain climate. Being a deep-rooted plant, its properties as a drought-resister alone proclaim it invaluable; while throughout the warmer seasons of the year it surpasses all other grasses in the rapidity and abundance of its growth, the severest of our frosts, although retarding its growth, do not subdue its evergreen state. It is most efficacious in subduing and preventing the growth of all noxious weeds. By the assistance of Paspalum many lands hitherto deemed worthless in their rocky, hilly or swampy situations, have been triumphantly reclaimed."

Use of Pastures.
The Agricultural (Govt.) Gazette of New South Wales says: "Throughout the length and breadth of the northern dairy districts Paspalum grass is regarded as the best of pasture grasses, and at present it has, no doubt, every claim to the position."

Mr. H. Munsey, of Dundas (N.S.W.) writes: "Paspalum is the grass that has revolutionized the dairying industry in the north coast. Scores of instances can be quoted showing that the capacity of farms has been doubled and tripled, and it forms a dense mass of succulent forage. Having spent over a month going through farms where this grass has been sown, I can safely recommend its planting on a large scale. I have seen farms where 100 head of dairy cattle have been kept all the year round on less than 100 acres of

land, giving splendid returns in milk and butter. This grass, if enclosed for a short period during autumn, will provide a good supply of feed for the winter. Its value to the State cannot be expressed in thousands of pounds."

Mr. Brandon, the well-known manager of the North Coast Co-operative Butter factory, says of Paspalum: "I do not know what this district would have done without it, especially during the very dry weather we experienced some time back. With regard to the quality of the butter manufactured from it, it is all that could be desired." This factory, which was established about ten years ago, and is owned and controlled by our farmers, for the month of October last paid away to its suppliers for cream and pork the immense sum of \$225,000, or at the rate of about \$2,500,000 per annum. Some of our dairy farmers for this month received checks for from \$500 to \$1800 for cream and pork. Nearly all the cows from which the milk is obtained for this factory are grazed on Paspalum and clover, and very few of them are either hand-fed or housed during the winter months.

Brings Prosperity.

Mr. Campbell, Director of Agriculture, after his recent visit to these districts, also says: "I have returned greatly impressed with the prosperity of the people in that part of the country. The Paspalum grass grows with extraordinary luxuriance, and so high is the growth that if it stood up straight, the stock would be quite lost in it. As it is, though bending over with its own weight, in many places, only the backs of the cattle are visible. Apparently, the cattle are unable to eat it down, and I believe that it would sustain five or six head of stock per acre for several months. Farmers are doing wonderfully well, and land is bringing high figures."

This grass has been known to yield, at the Wollongbar Experimental Farm, on cultivated ground, when four months old, twenty-two tons of green fodder, and several successive cuttings of over thirteen tons per acre, within the year. On fairly rich soil, where there is a good rainfall, this grass should easily sustain one bullock or ten sheep per acre, and from fifty to 100 pigs could be kept in good condition on a few acres, with the addition of some skim milk or other feed. All persons who have used it for this purpose speak very highly of it.

WHAT TO DO NOW.

During the dull time it is good thing to give the farm buildings a thorough overhauling and have them repainted and the premises cleaned up. May as well make the best of situation. A little paint does not cost very much and it may save much in after years. Give the wagons and farming tools a going over, and while your hand is in, try it on the buggy. It may not look as well as if done by a professional, but the preserving of the vehicle is the main consideration. Fix up fences and renovate things generally.

The suit of the heirs of the J. H. Glide estate has been successful and the sons of J. H. Glide will now inherit this magnificent property. Mr. Glide was the winner of so many premiums on his fine shorthorn cattle at many of our recent State fairs.

COW TALK

QUESTION—What is a cow?

ANSWER—As I said before, I am built square so that I can hold lots of food.

The Cow Talks: I have also been called a "milk machine." To a nail machine they feed wire and get nails. So they expect to feed me wire-y dusty, musty hay and get milk. Nothing in it. Don't expect to get wire nails from a nail machine without feeding it wire, nor milk from this milk machine when fed on wire-y hay, mostly trodden under my feet. I'll tell you what to feed me—fill me up on Kow-Breakfast-Food when I come in from the pasture.

Kow Mathematics: Then I'll give you 32 cents' worth of milk for a cent's worth of pulp. Besides, I figure I'll get fat at the rate of about one pound a day.

P. S.—You can get fresh Kow-Breakfast-Food at 50 cents per ton from the chute at

Los Alamitos Sugar Factory, Los Alamitos, Cal.

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Green Manure Crops.

What is the best green crop to plant in orange orchard for manure? When is best time to plant and how do you plant it? How do you analyze soil to find what is lacking? Is it best to inoculate the seed with bacteria to produce nodules? Where is bacteria procured and how is the seed inoculated with it? G. W. Rockefeller, Santa Ana.

Winter vetch is the best green crop as far as we know for your purpose.

When you give your September irrigation, plant as soon as you can get on the ground and furrow out for the next irrigation at the same time. Plant about forty pounds per acre with a drill.

The process of analyzing soils is long and intricate and cannot be done accurately without much practice and expensive apparatus. Take your soil samples according to printed instruction, which will be sent you on application to the Director of the Agricultural Department of the State University. Samples sent otherwise will not be accepted.

Mix with your seed a small amount of soil in which vetch grew last year. A quart to a sack of seed will do the work.—J. W. M.

Asparagus Quotations.

What is the reason that the asparagus quotations in the market were all this year much higher than in other years? The large asparagus fields in the North by the Sacramento river were flooded and I would like to know if the asparagus plants are rotted or the crop is lost, or is the consumption more than other years? H. H., Long Beach.

Doubtless a little of both. That is, all fruits are scarce this year, hence greater consumption along vegetable lines. Likewise, the production was very greatly reduced—a total failure in some cases along the Sacramento and San Joaquin rivers. This alone is sufficient to cause a great difference in markets.

The permanent injury to those fields is now found to be much less than at first anticipated so that later there will doubtless be a greatly increased production from those great fields.

Oil Meal.

Will you kindly answer the following question: What benefit is there to be derived from feeding oil cake meal to a milk cow and how much should be given at a feed? W. H. M., Pasadena.

Oil cake is added to feed of cows that have great capacity of milk or butter production to give them more concentrated food. It is really cow beefsteak. Now if you desire to feed it to a cow begin with a fresh cow by adding a tablespoonful to her grain ration and increase to half a pound twice a day. This is the most it is well to feed as it is too rich. When cows have been enfeebled with long illness it is also fed to bring them into strength and health rapidly. The cows going to a State fair are also fed on it as it gives them "mellow handling" and a soft skin. In other words, it puts them in high condition, and that is the quality that often wins out in the hands of the judges. M. E. S.

First Cutting of Alfalfa.

Kindly inform me how soon alfalfa is cut after planting in October in the vicinity of New Merced Co.—Mrs. P.

The early part of October is usually too early to sow alfalfa seed unless the land is very damp and dampness keeps near the surface. A better stand will be had if after the danger of hot dry winds past, which will be about the last of October or the first of November. The first cutting of the alfalfa should be done when the plants to a height of six inches. This, of course, will not make a hay crop, is left on the ground, but it serves to thicken the stand by forcing out branches and also destroys the weeds that may have sprung up. It is an advantage to cut a second time when there are many weeds. A so-called "nurse crop" of barley or grain is not beneficial, but rather the contrary, as it takes the moisture that should go to the alfalfa and sometimes chokes out the alfalfa.

After the early cuttings for purpose of thickening the alfalfa and getting clear of the weeds it is not necessary to do any work in the field except to keep it damp in a growing condition until the crop is ready to cut. This will be when the blossoms are beginning to show and will likely be about the first of April, depending on the warmth of the spring. After this a crop may be cut every 30 to 40 days until the weather comes again.—J. B. N.

Sour Sap.

I send you by post today plum branches. The leaves on out that far in spring and turn red and wither and remain so summer without any growth, except an occasional branch that grows which seems healthy. Kindly inform me through Cultivator of the trouble and remedy.—E. J. Thorson, Fresno.

The trouble with plum trees referred to in your correspondent's letter is apparently of the nature "Sour Sap," or failure of root action due to too much soil water and temperature after the tree starts to leave out. Plums, peaches and other stone fruits are often affected in this way. They start to leave out and then, when root action is stopped by a cold rain or rise of soil water, vitality of the whole tree or of certain branches becomes injured and they are not able to come out properly. Your correspondent's cation at Fresno leads one to suspect that his trees may be affected by common trouble in that region due to rising of the water level in the soil.

We advise cutting back all trees affected in this manner, hoping to get a new and better growth. If the soil water condition is decidedly wrong nothing but drainage will afford permanent relief.—Ralph Smith.

Citrus Paper.

Is there any paper printed in California devoted entirely to citrus culture?—J. B. K., Corona.

There is no such paper.

Hanford cannery is busy with peaches.

THE FLORIDA WHITE FLY.

There seems to be no longer any
doubt that the "Florida White Fly"
has invaded California. At least two
places have been mentioned in which
the terrible pest has been found—
Marysville and Bakersfield. An in-
dustry that is producing over \$30,-
000,000 a year in this State is seriously
threatened by this pest, and the most
heroic measures should be taken to
eradicate it. Prof. Woodworth of the
State University suggests that the
work of eradicating this pest should
be intrusted to the University ex-
perts in entomology, and that the
State appropriate the necessary funds
to carry on the work. With few ex-
ceptions, the horticultural commis-
sioners of the several counties in the
State received their appointments
either as rewards for political services
rendered or through the influences of
friends having "political pulls." But
few of them even today are suffici-
ently expert in the use of hydrocyanic
acid gas to insure success in fumi-
gation. Unfortunately for the welfare
of the great citrus industry, only in
rare instances have men with requi-
site knowledge of entomology been ap-
pointed as county horticultural com-
missioners.

Secretary Kendall, of the Citrus
Protective League, in his report on
the "White Fly," says: "Now that two
localities in this State are infested,
the first great duty is to find if the
pest has a habitat elsewhere within
our borders, and every available ex-
pert and competent inspector should
at once begin the search. Don't wait
to be urged to assist in this work.
Its importance cannot be overesti-
mated. If the county in which you
live has no ordinance of quarantine
against Florida trees and shrubs, see
to it that one is passed. If your coun-
ty horticultural commission is ineffi-
cient, don't rest until it is organized
for the best interest of the fruit in-
dustry, which has grown to \$30,000,-
000 a year, and must not be destroyed
by inattention or inefficiency."—S. A.
Conner, in Los Angeles Economist of
Sept. 5.

INTERNATIONAL LABOR SAVERS.

The passing of the horse, the mule,
the ox, as indispensable factors in the
operations of modern farming, is fore-
shadowed in the exhibit of the Inter-
national Harvester Company at the
Jamestown Exposition. Here is shown
a great variety of motors, stationary
and portable, by which great labor-
saving machines are operated, and for
performing many functions of the
horse, barn and field that have always
been associated with toil and drudgery
for both man and beast. By pressing a
button or turning a valve, the up-to-
date farmer can plow his land, harrow
it, sow his seed, cultivate, harvest and
thresh his crop, saw wood for his
kitchen, pump water for domestic or
irrigation purpose, cut ensilage, shell
and grind corn, separate cream, churn
butter, light his buildings by electric-
ity and do scores of other things that,
while saving labor and money, make
life pleasanter for himself and his
household. Power is now so easily and
inexpensively applied that the demand
for farm motors is as important as that
for the machinery equipment. The
question is not "will a gasoline motor
meet my needs," but "which will serve
my purpose?"

The gasoline has reached the prac-
tical stage; it is now a necessity. The
economy of its direct power is un-
doubted. Motors shown in the exhibit
have been subjected to all tests, and
are found ever ready and effective at
a minimum of expense. They require
no engineer, no fireman, no far-fetched
water supply. They do require a sup-
ply of gasoline—less than a pint per
hour per horse power. A ten-horse
power motor running at full strength
consumes about a gallon an hour. No
special operator is needed. When
ready, the farmer turns a valve, gives
the fly wheel a revolution or two by
hand, and is then free to attend to other
work; the motor will run itself till he
closes the valve again.

There is shown in this exhibit a ver-
tical motor, mounted on a substantial
truck, adapted to use on rough roads,
that may be drawn by hand or by
horse to any part of the fields or wood
lot. To it is belted a circular saw,
whereby limbs and trunks of trees can
be readily converted into firewood on
the spot where the tree is felled. By a
simple appliance the saw may be made
to do the work of felling the tree. This
motor can also be attached to a
thresher in the field or made to cut and
then haul ice from the river or pond
for storage against the summer. It
can be wheeled to the dairy and made
to operate the churn or separator. Its
uses are manifold and obvious. Its
first cost is small, and its operation in-
expensive. The average running ex-
pense may be figured close to one cent
per hour per horse power.

So with the stationary motors. By it
can heavy threshing or pumping ma-
chinery be run as though by the
strength of a child. A two-horse power
will operate a dynamo that will supply
current for 20 electric lights of 16-can-
dle power each—more than are ordi-
narily needed at one time in any farm-
er's house.

And there is no danger connected
with these motors in themselves. The
fuel is ordinary stove gasoline, which
only becomes dangerous when used in
an enclosed room where there is an
open light flame. It is never necessary
to use a flame about a Harvester Com-
pany's motor, as ignition is produced
by an electric spark. The gasoline sup-
ply should be stored in a tank out of
doors, in which case every element of
danger is removed. In use the motor
emits no smoke, scatters no sparks.
The technical knowledge required to
operate the motor can be very quickly
acquired by any man or intelligent boy.
In case of breakage, any part can be
promptly supplied by the nearest deal-
er. In construction the motor is sim-
plicity itself.

THE OLD MAN'S MOTTO.

"Give me a motto," said a youth
To one whom years had rendered wise;

"Some pleasant thought, or weighty truth,

That briefest syllables comprise;
Some word of warning or of cheer
To grave upon my signet here.

"And, reverend father," said the boy,
"Since life, they say, is ever made
A mingled web of grief and joy;
Since cares may come and pleasures fade—

Pray let the motto have a range
Of meaning, matching every change."

"Sooth!" said the sire, "methinks you ask

A labor something overnice,
That well a finer brain might ask,
What think you, lad, of this device
(Older than I, though I am gray),
'Tis simple, 'This will pass away.'

"When wafted on by Fortune's breeze,
In endless peace thou seem'st to glide,

Prepare betimes for rougher seas,
And check the boast of foolish pride;
Though smiling joy is thine to-day,
Remember, 'This will pass away!'"

"When all the sky is draped in black,
And, beaten by tempestuous gales,
Thy shuddering ship seems all awrack,
Then trim again thy tattered sails;
To grim Despair be not a prey;
Bethink thee, 'This will pass away.'"

"Thus, O, my son, be not o'erproud,
Nor yet cast down; judge thou aright;
When skies are clear, expect the cloud;

In darkness, wait the coming light;
Whatever be thy fate to-day,
Remember, 'This will pass away!'"

—John Godfrey Saxe.

"DAN'S" BLACK MORGAN.

A number of years ago when there were stretches of wild prairie in Northern Iowa, when log cabins of the backwoodsman still nestled here and there in the shelter of some thickly wooded hillside, Bert Daniels used to take his four-horse team, big covered wagon and breaking-plow, and each summer start on a trip to the Dakotas. All summer he would follow the breaking-plow, moving on to the next job as soon as one was finished. Sometimes he would barely reach Dakota before the season would end; other times he would travel across Iowa without more than half a dozen stops.

While working in the Western part of the State one summer, "Dan"—as he was familiarly known, came across a Morgan colt that just struck his fancy. She was less than a year old at that time yet she showed an unusually aptitude for learning. As Dan's work kept him at that place for nearly four weeks, he and the Morgan colt became quite good friends. Her gentle, playful disposition, together with her extreme beauty, suited Dan especially well, so he made up his mind to buy her and take her with him.

When Dan was at work, "Trilby"—for that was the name he gave her—would roam about the field, grazing when and where she pleased. Dan soon taught her to come at his call, and it was not long before she would place her hoof in his hand in response to his command, "Shake." She also learned to trot in a circle around him, to lie down and to rear her hind legs at his command. Another little trick which she had developed herself and one which pleased Dan very much was that of whinnying when any one approached her. By the time

they were ready to return in the fall, Trilby had also learned to travel along beside the team without being tied.

Each spring she went off with Dan's outfit, followed it all summer, and came back with it in the fall.

At three years of age she was a neat, well-proportioned animal, weighing perhaps thirteen hundred pounds and fleet as a deer. Her black coat always glistened, her fine mane hung nearly half way to the ground, her nicely arched neck, her clean-cut head and quivering pink nostrils spoke of refinement, while out of her bright eyes flashed spirit and vigor.

Late one afternoon, as Dan was making his homeward trip after a successful summer's work, he stopped in a fair-sized town lay in supplies for the rest of the journey. As is usually the case, there were a number of persons standing in front of the store at which Dan had stopped. Just for amusement, Dan ran his hand along Trilby's neck and whistled a word or two as he passed into the store. Immediately she laid down. There was considerable talk among the bystanders about a wornout and sick horse. Finally one man even ventured so far as to step out to examine her. As he touched her head, Trilby gave a low whinny. A sharp, short whistle answered from the store and Trilby was upon her feet so quick that the man who had been bending over her went sprawling in the dust. A general laugh from the crowd greeted him as he got up and watched her trot over to playfully tease the other horses.

As Dan was preparing to drive away a tall, dark stranger with small, twitching eyes, and thin blue lips accosted him with "What'll you take for that colt, pard?"

"Oh, guess I won't sell her, can't spare her, you see," was Dan's evasive reply.

"Well, I've got a fine one down at the barn I'll trade for her," persisted the stranger.

Dan assured him that he was not a trader; and after a few moments drove off leaving the stranger with an increasing desire to obtain that colt.

About a mile or so from town Dan pulled up for the night at a sheltered place where there was plenty of grass. After he had had his supper and the horse had finished grazing he fastened the four, two at each end of the wagon, then crawled in and rolled up in his blankets. The weather was just cool enough to discourage the attacks of the mosquitoes and other insects, so the horses were quiet and Dan soon fell asleep.

In the middle of the night he found himself propped up on one elbow, half awake listening for something, he knew not what. At length he was fully awakened by a low whinny from up the road. Half suspiciously he crawled to the back end of the wagon and pushed aside the flap of the cover. There, some thirty or forty rods up the road silhouetted against the sky, Dan saw the forms of the tall, lank stranger and—Trilby. He sprang from the wagon, uttering a shrill whistle. Hardly had the notes reached Trilby's ears till she reared up in the air and gave a tremendous lunge forward. Whether from fright or surprise, the stranger dropped the

rope and ran. Dan's only worry was the neckyoke which he had consciously picked up, so he contented himself with conjecturing as to what would have happened had he been better armed.

Trilby came tearing down the frightened at the curious proceeding and urged on by the dangling which kept flicking her breast chin. As she reached Dan she paused, blowing loudly, every quivering with excitement. She moved the halter, and as he stroking her silky mane concluded that she had paid him well for time he had spent in training her.

From that time on Trilby had more care than before and became even a greater pet. This was interrupted, however, when the fall she was five years old, Dan bought interest in a threshing outfit. He was scarce and Dan was forced to break Trilby in on the power. She was a careful driver, however, and frequent changes soon had her her share of the work.

During the next ten years she was on the power a good share of the time, for Dan bought a well-outfit which he ran with it. She was not threshing. Dan used to that she seemed to enjoy that. Anyhow it did not worry her, for she was always sleek and fat.

One fall Dan and his partner bought a steam engine—the first that section—to replace the wornout power. With the advent of the engine Trilby was given an honorable discharge and turned into large pasture.

It was a sweltering hot day the first of September when the engine was started up for the trial run. The engine ran fine and the separator hummed steadily until noon. At dinner, Dan speeded the engine "just to see what she'd do," he said. It was still and the dust hung in the separator like a dense fog. After another, the men sought shade, panting for breath, and wiping the perspiration and dirt from their faces. Finally Dan slowed down to the regular motion and thus ran until quitting time.

After the chores were finished, he could not resist the temptation to take an ear of corn down to Trilby. He went down to the gate, sounded her usual call. He repeated it several times but received no answer. He thought that some accident had befallen her, for he could not remember a time when she had answered his call, even though she were on the opposite side of the pasture. He concluded that he would go down below the grove, anyway, where he could get a view of the larger part of the pasture. There at the edge he saw Trilby lying stretched out. At first he thought she must be sick, and not until he was in a few feet of her did the dawn upon him.

She had heard the hum of the separator and its familiar call seemed imperious to her. There in the grass, was a circle the exact of the one she used to travel in on the power. But the steady steam engine, which needed no relay, had been more than a match for her.

She was dead!—Kansas Farmer

We live in deeds, not years;
In thoughts, not breaths;
In feelings, not in figures on a dial.
He most lives
Who thinks most, feels the noblest,
acts the best. Philip Ball.

rain through cheese cloth into eglasses. This will be found a d and reliable rule for nearly all ties of jelly, with the exception rape, which is often quite vexa- with its perverse inclinations. A grape jelly which will not crys- is made as follows: Cover y ripe grapes with water, boil

twenty minutes, strain through a bag without squeezing. Let it stand over night, strain again, and boil twenty minutes. Add a pint of sugar for every pint of juice, and boil five minutes, then strain into jelly glasses.

HOMELY HINTS.

Steel ornaments may be restored by soaking in olive oil for forty-eight hours then polishing with unslacked lime.

Faded artificial flowers may be touched up with water colors and a camel's hair brush; or by shaking them about in a mixture of oil paint thinned with gasoline, the original hue may often be restored.

Rust spots may be removed by sprinkling powdered alum and salt over them, steaming over the tea-kettle spout and then putting the garment or piece of cloth out in the sun. fitted flat into each heel.

A tablespoonful of melted lard poured between the frame and casing of the window that sticks will help it to raise easily.

Rubbers will last much longer if a piece from an old rubber is cut and

For light summer dresses gum arabic is a more satisfactory stiffener than starch. A few pieces dropped in warm water to soak over night will make enough liquid to dip two or three dresses when thinned with warm water to the same consistency as ordinary starch. Flatirons will not stick in ironing garments which have been stiffened in this way.

Another laundry help is dye for cotton or linen, dissolved and bottled ready to use as one would bluing. Pink, blue, red, lilac, green and yellow may be prepared according to the directions that come on each pack- age, and used, a little at a time in rinse water, to brighten faded garments.

Grease spots on marble may be removed by applying powered magnesia.

When the kitchen linoleum becomes shabby, paint it a soft yellow brown. It will have the effect of a hardwood floor.

Boiled eggs, to slice nicely, should be put over the fire in cold water, and should remain fifteen minutes after the water begins to boil and allowed to cool in the same water. If cooled by dropping into cold water, they will not cut smoothly.

CINDERELLA.

The teacher had been reading a story of Cinderella to her class of youngsters and was now going over it again in order to fix it in their minds. Among other questions which she asked them was why it was necessary for Cinderella to leave every night early enough to be home by twelve o'clock. From various members of the class she elicited most of the reasons which are im- plied in the story, until finally all re- mained silent.

"Isn't there any other reason? she asked. "Can't any of you think up another?"

Up shot Larry's soiled, chubby paw, in frantic eagerness to indicate his knowledge.

"That's good, Larry. What is the reason?"

"She had to catch the last car." piped Larry.—Puck.

City Niece—"What kind of a chick en is that, Uncle Josh?"

Uncle Josh—"That is a Leghorn."

City Niece—"How stupid of me!

Of course I ought to have noticed the horns on his legs."—Chicago News.

Dried Fruits.

The dried fruit market is surely in a bad way. Not that there is a serious slump in quotations. In fact, there are practically no quotations being made. All stand and ask where are we at, the buyer refusing to buy, and the seller refusing to sell. Of course, it is all owing to the pure food-sulphur ruling, and the fact that the Armsby Co. are repudiating contracts. It is said that the North Ontario Packing Co. are standing up to their contracts. But all dealers who buy at full quotations are liable to loose, because of a possible shading of price and the fact that the pure food ruling gives Eastern jobbers a legal excuse to turn down the shipment absolutely, and then buy, if they can force the packer into line, at their own price.

Mr. Perry R. Wilding, a large broker in dried fruits and nuts, informs the Cultivator that the output of dried peaches in this State this year will be about 14,000 or 15,000 tons of which nearly 10,000 tons will be produced in the San Joaquin valley. The loss on this vast output will be enormous, unless something almost miraculous occurs to offset the fearful blunder of the pure food section of the Department of Agriculture. The announcement of Secretary Wilson that no prosecutions will be made this year has but little effect as yet, for the ruling having been made and not officially revoked, gives the club to the Eastern buyer with which he can beat the life out of the market.

There is no change in quotations. In fact, there may be said to be no quotations for there is nothing doing.

The only advice to be given to the grower is to keep cool and wait developments.

PRACTICAL MISSIONARY EN- DEAVOR.

Missionaries in Armenia are en- deavoring to do some practical work by establishing a farm school for the nations. It is in charge of Geo. P. Knapp of Harpoot, Turkey, who writes:

"We have received \$6000 towards a farm. This is about a third of what we need when buildings, stock and implements are added. An Arme- nian graduate of the Massachusetts Agricultural College can manage this work with the thirty boys who have been in training for two years on hired land. One of our boys has se- cured a diploma from the Sericultural School at Brousa, and takes charge of our silk raising interests. In this agricultural center there is a fine opening for an agricultural school, affiliated with Euphrates College, where scientific methods may be taught in connection with the use of American implements.

"Situated as Harpoot is, within a great ox-bow of the Euphrates, about an equal distance from the Mediter- ranean, the Black Sea and Lake Van, makes it a fitting place where our present plant can develop into an industrial institution similar to Hampton and Tuskegee in America. It is far better to train these boys and girls to be a blessing to this country than to let them drift, as some have done, with the strong tide of emigration to America."

KEEP BUSY.

Everything seems to know that un- less time is taken by the forelock now it will soon be too late. Under irri- gation, the hot weather dries out the ground rapidly. All kinds of summer weeds, such as pusley, tumble weed, sunflower, etc., grow very rapidly, and frequently an absence of a few days from a particular part of the orchard reveals the fact in an astonishing de- gree. Between irrigation, alfalfa cut- ting, where this is grown, cultivating and attending to the rapidly ripening fruit, the grower has his hands full.

The Vacaville Company has been formed to manufacture pear blight re- medy. The capital is placed at \$10,000. The officers are: President, Fred M. Buck; Vice-president, Dr. Langfeldt; Secretary and Treasurer, I. Blum.

OPPORTUNITIES OF TODAY.

Opportunities of Today, a high-class monthly magazine built upon entirely new and original lines, will make its initial bow to the public with the Sep- tember number. As its name implies, the publication will deal with bringing to the notice of opportunities seekers, the many and various chances for wealth and homemaking that are opening throughout all the United States.

The home of the new magazine is the Majestic building, 73 and 75 Mon- roe street, Chicago. Advance sheets of the publication indicate that no ex- pense will be spared to make it one of the most striking and elaborate pieces of work of its kind ever published in this country. The first issue is said to represent an expenditure of very near- ly \$30,000.

THE TRAINING OF THE HUMAN PLANT.

A valuable book recently received is well worth perusal by Cultivator read- ers, especially those who have to do with the training of the child. It is

Luther Burbank's "Training of the Human Plant."

Out of the richness of his years of experience and investigation, Mr. Bur- bank urges an ideal training looking to- ward an ideal race. He shows that we are more crossed than any other na- tion in the history of the world, and that we meet the same results that are always seen in a much-crossed race of plants; if we follow the teach- ings of nature, we may produce the finest race ever known. He demands for the child of the race—most sensi- tive of living things—first and fore- most an heredity and environment of love; differentiation in training, sun- shine, good air and nourishing food.

While "The Training of the Human Plant" makes special appeal to par- ents and teachers, the strong, sane, in- tensely interesting, and illuminating treatise should have general reading.

Published by the Century Co., New York, 65 cents.

TUTTLE'S ELIXIR.

34 West Union Street, Pasadena, Cal. Pasadena, Cal., May 7th, 1907, Dr. S. A. TUTTLE,

Dear Sir: This is to certify that I have used your Elixir and find it all you recommended it for Colic and Mud Fever. I have had the very best results in all cases that I have used it. I can fully recommend it to all and would not be without it in my stable.

Yours truly,

John McDonald, Mgr.

THE MODEL STABLES

ANTHRAX.

Cattle owners will do well to get in touch with the Pasteur Vaccine Co., 441 Wabash Avenue, Chicago, who can send valuable information regarding Anthrax or Charbon. The firm re- cently issued a valuable circular on this topic which reminds the stock grower that his cattle are not im- mune to this dread disease yet.

MILK COOLER.

One of the most common sense of milk coolers and aerators we have seen is manufactured at Riverside, by Stephenson & Tharp. It consists of a container which allows the warm milk to escape into a long, spiral channel underneath which is a stream of cold water. The milk escapes from the lower end of this channel not only cooled, but thoroughly aerated. In fact, as the manufacturers say, it is simply perfect and perfectly simple. Nothing quite so good. The cost of run- ning machine is a mere nothing. We make it large enough to accomodate a dairy of 60 cows.

It is well worth getting the informa-

tion about, which can be done by writing to Stephenson & Tharp, Riv- erside.

BUDDED ROSES.

An exclusive trade list of field-grown roses is given in an eight-page folder issued by Fancher Creek Nurseries, of Fresno. It has the names of a couple of hundred of Mr. Roeding's choice roses, field-grown, with prices to the trade.

A recent statement of the German- American Savings Bank of Los An- geles, shows deposits aggregating 9,584,376.08 which with \$600,000 capital and nearly \$300,000 undivided profits, makes an aggregate of nearly ten and a half millions. It is a strong institu- tion conservatively and honestly man- aged and worthy the trust which its patrons have granted it.

Orange county is contemplating a bond issue for the Newport protection district, to secure control of the stream in time of storm. The cost to the dis- trict will be from about \$9 to \$10 per acre for these improvements, or a total of \$183,000.

Exepriments are being conducted at Fresno in the sulphuring of fruit. One experimenter has found that one pound of sulphur is sufficient for 2850 pounds of green fruit.

Coulson's Improved Mash Egg Food

**Takes
Less
Feed**

**Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Columbus Engines

MADE BY THE.

Columbus Machine Co., Columbus, Ohio

Have stood the test fourteen years.

2 to 60 Horse Power

Here's a Good Word from a Man Who Knows

Los Angeles, Cal., July 8, 1907.

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement over 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully recommend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropic, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, we beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,
By E. B. Barry, Manager.

Pitch Your Tent at Home

A Summer Vacation May Be Spent at Home and Prove the Means of Far Greater Happiness Than Any Beach or Mountain Trips. A Few Hints from One Who Has Tried

FEW YEARS AGO in discussing plans for spending the Fourth of July, our household was in straits to decide as to which resort or what place to choose to go with our presence. Which would give us the most pleasure and patriotism? With the least fatigue, fret and fuss in going? Incidentally, which the least expenditure of money worked for coin of the realm?

Each place had its good points and, strangely, each had its objectionable ones. The one great object, however, obtained in the case of all was suggested and that was that on that day push and jam and push and haul to get seats, rather, get a place to put our feet when others didn't stand on them. In the cars, was such that all united in saying "Let's don't go at all." It came hard for the boy, a few years under majority, but in consideration of other good and sufficient compensations he finally yielded reluctantly.

When I came in with a suggestion that we all in and work—play I mean—with the plants and flowers about the house and especially construct a little lath house for which we had long intended to propagate plants, grow hanging baskets and incidentally swing a hammock and afford a lounging place out of sight of the passerby on the street. The idea was accepted by the family and the lumber ordered. The lumber bill was a few dollars—less than five—for we used one of the woodhouse and a high fence for two sides of the summer house, so that the outlay was far less than for the family to have gone on a hunt to some resort.

Work was taken up with a will while fire-crackers were exploding and people going by in gala attire. It was finished, hammock swung and pillow and blanket most inviting, with plants arranged gracefully about the sides of lath and baskets of ferns from roof and, better than all, tasty table with dainty luncheon of sandwiches, fruits and ice cream in the center with a little family about at the time of the gloaming when these same "gala day attired" folks were coming home. They were tired all right, but of course they had had a "big time." We hadn't, but our "little time" was at that moment being intensely enjoyed. And we voted it a successful restful day, the result of which would give many days' pleasure in the months to come. I came up to our expectations in that, and later took a restful trip to the ocean when the word was not there.

But what has this to do with Camping out at home? Nothing. Or at least it's only the prelude for the sermon to follow.

to the Subject.

It goes without saying that when one has put in a good, straight year's work he, she too, is entitled to a few days rest. Russel Sage said this vacation business was all bosh, but the rest of us have decided he didn't know. Then the question is, how get our rest without getting all tired?

The above Fourth of July gave me a hint. I'll pitch it on and enlarge upon it a bit.

Fortunately, in California, most of us think our little section the cream of the earth. I remember of the old days "back east" how a grumbler was about in the land kicking over the condition of his own community, its climate,

its people—everything. California has few of that class.

Read Mrs. Sherman's article on dairy page. Note how she glorifies San Joaquin Valley climate, and revels in the heat of the sun which gives sugar to the grape and wealth to the grape grower. Read John Isaac's claim for Sacramento as a summer resort.

Some of us who have been unfortunate in striking Sacramento at fair time, when things fairly sizzled may be surprised, but we believe Mr. Isaac's claims are good.

And I can imagine a most enjoyable camping time under the great eucalyptus and peppers—in appearance almost like the forest primeval—at Mrs. Sherman's Minnewawa home. It is a beautiful place. All homes may not be so beautiful as hers, but many may be made more beautiful than they are now.

This Year's Experience.

So when my vacation came this year I spent two straight weeks of working—playing I mean—about my own home. I had the hint from that Fourth of July experience. And, as before, I had—and am now having—more pleasure from that one vacation than any other. Pleasure not only at the time of the playspell, but in possession of its results.

A "Spoon Holder."

I have a place of about an acre. Part of it an unsightly hillside. Part way down a clump of peppers started from some seed carelessly scattered some years ago, grew in a tangled mass with weeds and underbrush. Winding down the side of the hill to this, son and I made a trail. The underbrush and weeds were cleaned from under the trees, a short retaining wall built and a level place graded within the clump in which a settee and a rustic seat gave a cozy and secluded retreat which at once took the name of "spoonholder."

Trees were planted, vines trained up and the place generally tidied up. The trees planted were various kinds of eucalyptus, cedars, live oaks and other forest trees which will make my home grounds more of a "camping place" some day.

Pitch Your Tent at Home.

But, you say, the farmer's work is along that same line all the year. That would be no change hence no rest. But that is not the case entirely. The creating of beauty about the home and the anticipation of pleasure from the more pleasant surroundings will give a zest to the work and rest almost the equal of an outing at the beach.

Besides, the camping out feature may be entered into on the home grounds. Sleep out doors. Buy a side of bacon, a lot of canned goods and camping supplies generally and live in the open. Don't have the everlasting "boiled dinner," but get down to simple life.

Work—play rather—short hours and rest and get acquainted with your family. Don't be inveigled into doing any farm work that "just has to be done." Cut it out. You are on your vacation, and don't know anything "has" to be done. When you "get back" it can then be taken up.

An Arbor Too.

If your plan takes in the planting of trees that may not be bought in pots and planted at this season of the year, still plan and work to the end that later they may be planted and your home beautified with great forest trees. Another feat-

ure to be planned is a grape arbor, broad and spreading near the back door.

Of Commercial Value.

Let your vacation impress upon you the commercial value of trees about the home, they raise the value of your own and your neighbors places. They make your children more content with the old home. Their grateful shade will make you more able to do a big day's work at the busy time of the year when you anticipate the pleasure of a cool place about the back door at noon time.

About the Wife.

So, camp out at home and plan more beautiful things for your own and others happiness. But, as to the wife. That is another question. She has been shut in the house more closely than you have. You have been to the institutes and more or less come in contact with the outside world. This is also sometimes true of the wife, but more often not. So send her away for a vacation, a visit to the old home if she needs it, then surprise her with the neat looking place when she comes home. But regarding her vacation the Household Department of this issue will give hints. Read it with your wife.

A Farm Home With a Name.

While you're resting and playing, think up a name for the old home. Call it Wildwood or Woodside, or Hill Crest or Sunny Slope or Rose-lawn. The Maples (if you do make it true to name) Orangedale, Olivet, Wayside or any one of a thousand names which may be used. They have more than a sentimental value.

Don't Be Provincial.

But with the added love for your own little dominion and the realization that it is just a little the finest spot on earth, don't become provincial. Get as broad a view as possible of the rest of the world and grant others the right of having other "finest spots." A few good books, bought with some of the money a vacation trip would have cost, will aid in preventing the narrowing tendency.

Now, if you are one of the unfortunates, or fortunates, who have not been on a camping trip this year don't feel sorry for yourself, but try camping at home then write the Cultivator as to whether you think it a good plan.—C. B. Messenger.

CALIFORNIA'S BEAUTIFUL RESORTS.

This is the ideal season for outdoor camping. California abounds in healthful resorts, unsurpassed by any State in the Union, for beauty and accessibility. Within a hundred miles of San Francisco, are some of the most romantic spots to be found anywhere on the Pacific Coast where mountains, lakes, canyons and rushing streams provide ever changing scenery and the best of health conditions.

Southern California, while not so rugged nor varied in its environments, has beautiful inland and seaside resorts, which vie in attractiveness and restfulness with the far-famed tourist rendezvous of France or Italy.

The advent of the automobiles is a very important feature in promoting outdoor life. In its use pleasure and health are gained and knowledge obtained of California's attractions which can be gained, as readily, in no other way. With the coming of a better system of road making (speed the time) we shall bring to our State thousands of tourists who prefer this method of seeing California to any other. With out doubt, we have lost hundreds of visitors, within the past year, because the information has gone abroad that many of our roads are incapable of tourist travel by autos.

Deciduous Fruit Culture

VACATION TIME.

WHAT can a fruit grower do to get away during the warm summer months and have a few days good time in the mountains or at the beaches? If he has a crop of mixed fruit, he will find no greater enjoyment than staying right at home and attending to business. During these days of scarcity of labor, it will keep him hustling to enjoy the good old summer time, for that is the only way he can do it. Anything that brings in a little cash must be utilized, especially if he is a small grower. The large grower usually has a trusty whom he can leave in charge and a few days absence makes very little difference. We do not know but what it is a good thing to go away for a few days in such cases and give the foreman a chance to try his mettle. At any rate it is as good an excuse for the vacation proposition as the small boy is for the circus proposition.

The Ranch Will Stay at Home.

Many farmers imagine that a few days away from home means ruin to the ranch. He forgets that the ranch will stay there and be run when he is dead. This staying-home habit is acquired. It is not natural. There are many things that can be done to make the vacation an easy matter. One item is the selection of crops. It is perhaps hard for a small farmer to select his varieties so that one crop will follow one after the other closely through the season. Few do this unless they are peddlers who raise their own stuff. It is usually a better paying proposition to devote the land to a few things of the best standard varieties.

There is always a lull in the work at some time. Then is the time to have the most trusty of the hired help used on the last job, if a permanent man is not employed, and take a run off some place. Things will look different when you return home even if you only stay away a week.

IRRIGATION.

The deciduous fruit grower has an advantage over the citrus grower in the question of irrigation. The former irrigates less frequently and has, with most varieties, a long period in which there is no fruit to irrigate. He simply has to see that the trees mature the fruit buds and keep in a thrifty condition. He can give longer irrigations with better results because the roots of deciduous trees grow deeper, hence the question of irrigation, while important, is not as serious a one as with the citrus grower. The latter must be "on the spot" with the water with fearful regularity; if his trees show the need of water, it is a sign that they have gone too long for the good of the trees. The soil in a citrus orchard may, upon examination, seem to be amply moist, but a few exceedingly hot days may cause the trees to suffer. The immensely increased evaporation will draw heavily on the surface soil which contains nearly all the roots of citrus trees. In the case of deciduous trees it is quite different. The foliage of the two classes of trees may evaporate an equal amount of moisture, but the roots of the deciduous trees have the advantage of lying deeper and being in a position to draw on a much larger area of soil. Such sudden and exhaustive draughts on the soil cannot be made as in the case of citrus trees. This simplifies

the work of irrigation to a very extent. It means that the deciduous trees have a subterranean reservoir of larger capacity than that of citrus trees.—J. W. Mills.

SULPHUR IN THE COOKED FRUIT

The real contention between fruit growers and the Agricultural Department will narrow down, or at least, to the amount of sulphur actually remaining in the fruit after cooking and preparation for market. The process of cooking removes a certain amount of the sulphur dioxide and the amount of fruit comes within the limit prescribed by the department. At this point we have a letter written by Curtis & Tompkins, chemists of Francisco to the Minnewawa Packing Co. of Fresno, and from them we quote:

"Experiments conducted in our laboratory for the past few months on sulphured fruit, and one particularly in keeping with questions asked by the meeting of the growers and the department before Secretary Wilson last day, has developed facts which we believe of sufficient interest to warrant distribution of the results to those concerned for whatever benefit they may derive from this work. A well known fact that cooked fruit contains a very small proportion of the sulphurous acid originally contained in the material, was the basis of an extended series of experiments under varying conditions, and with a large assortment of fruits, differing widely in the amount of sulphur dioxide contained.

"In order to ascertain exactly what percentage remained in the edible product, the following work, briefly stated, consisted of soaking the fruit for different periods of time, and in one case, the water so used was removed and subjected to analysis; the water was then added, the fruit was then added, the sulphur dioxide determined therein. In another series the fruit was cooked with the same water as in soaking, and the remaining sulphur dioxide determined.

"The result of these two determinations show but a small difference in the final result (sulphurous acid remaining in the cooked material), hardly enough to be practically considered, though clearly in favor of cooking with fresh water after soaking.

"Owing to limited space and lack of time to tabulate the entire work, four samples representing each of this and last year's pack have been selected to demonstrate the results which are here appended. It is clearly seen from these results that the sample containing sulphurous acid considerably in excess of the present limit of 0.035 per cent is reduced to figures below the requirements for the fruit is ready for table consumption. It may be further stated that practically all the sulphurous acid remaining is combined, and not in free state. Cooking the well-soaked fruit has developed the fact that sulphurous acid is retained in the final product, than when the fruit is subjected to cooking with previous soaking, even though it is cooked to the same degree of softness.

"Throughout these experiments the fruit was cooked just to a point where it was fit for table consumption, represented about 20 minutes for fruit soaked over night, and about one hour for the fruit not soaked at all with the others in like proportion. In no instance did the fruit lose its shape from excessive cooking. It must be remembered, however, that the results obtained are correct only in a general and practical manner. The amount of sulphur, the age and kind of fruit, the time and manner of cooking, etc., would alter the results to a certain degree.

"Inasmuch as a very small fraction of 1 per cent of dried fruit is consumed in that state (without cooking,) it would appear that a favorable consideration of these facts should be taken into account in fixing the limitation of sulphurous acid applicable to the dried fruit trade."

Irrigation and Forestry

THE IRRIGATION CONGRESS.

The National Irrigation Congress, which will be held in Sacramento, Sept. 2-7 next, promises to be the most important of the liveliest debates in recent history. The management of the public lands is practically challenged both the supporters and the opponents of what is known as the Administration Policy. With reference to the public land and their respective positions on the subject here.

The question of how far the National Government should go in the disposal of the public lands is recognized as one of the leading questions of the American people, and the National Congress management wants it discussed because it promises that this shall be a Congress of live up-to-date issues. During the last two or three weeks letters and telegrams have been sent to the headquarters in this city to those who are especially prominent whose participation would make a debate of National importance.

Gifford Pinchot, United States Forester, has responded with the assurance that he will come prepared to debate with any man the Government's Forest Policy. Among others who have been invited to interest themselves, either by participating in person or by seeing to it that the issue is properly presented here, are U. S. Senator Burkett of Nebraska, Governor Frantz of Oklahoma, Senator Nelson of Wyoming, Senator La Follette of Wisconsin, Senator Spooner of Wisconsin, Senator Nelson of Minnesota and Murdo McKenzie, President of the American Live Stock Association of Colorado.

Among the opponents of Administration Policies who have been active in the matter of U. S. Senator Heyburn of Idaho, Governor of Wyoming, Governor Bucher of Colorado, Congressman Montague of Wyoming, Congressman Cushman of Washington, Senator Clark of Oregon, Senator Fulton of Oregon, Senator Patterson of Colorado, Senator Carter of Montana and Dr. J. M. Wilson, President of American Wool Growers' Association of Wyoming.

PRIVATE PROFIT vs. PUBLIC BENEFIT.

We have objected to National Government lands on the ground that they interfere with "the development and improvement of title." This objection rests on the assumption that the land in America must be privately owned, and operated for private profit. A queer situation we find ourselves in, truly, if this were consistently acted upon. School lands would be converted into privately owned lands; our streets, ways, public parks, public gardens, national cemeteries, experimental farms and gardens, sites of public buildings and all other public lands would be converted into private property. Government, in all its aspects, would exist simply as a renter or go-between of business. Fortunately, the American people are too sane to consider seriously such a theory. The man who recently proposed to turn the National Postoffice as a private venture was smiled at and forgotten. The point to be remembered is that while private enterprise and ownership have their place, public enterprise and ownership have theirs. The "development, and acquisition of title" in public property by private individuals is not a matter on which the public will grow enthusiastic.

FEDERAL "ENCROACHMENT" IN WESTERN STATES.

Stress has been laid by some upon Federal "encroachment" upon certain Western States occupied by National Forests. For instance, a map of Idaho, mutilated by cutting out the National Forest area, was exhibited at the recent Denver convention. Attention was called to the fact that nearly one-fourth of the State of Colorado is also in National Forests.

Well, what of it? If this area were actually subtracted from the State, Colorado would still be larger than the eight States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey and Delaware. But this area instead of being subtracted from the State is being preserved from destruction and made available for the highest use of the people within and without the State.

IRRIGATION IN DINUBA.

This section of Fresno county is irrigated from Kings River by means of large canals which have diverted those waters, and the entire territory is under one vast system of irrigation, where the waters for irrigation are had for a minimum cost, and at less cost than of any other irrigated district in the San Joaquin Valley. It is not to be inferred, however, that irrigation is necessarily required to produce crops in this district, as grain crops are grown there in abundance without irrigation, and many portions of this territory do not require irrigation for the production of vineyard and orchard. Much of the land sub-irrigated and produces abundant crops

of all classes without any irrigation whatever, other than from the natural seepage of the land from the system of irrigation mentioned.

That Sparta proved ungrateful boots nothing in the present case. Happily for America, sectional rivalry within her boundaries is past. No section of this republic need grudge or fear the progress and prosperity either of New England or of the South. The welfare of these sections is the welfare of our whole nation. As Paul well said, "We are all members one of another;" and if one member suffer, all the other members must inevitably suffer with it. Do any imagine that the reclamation of Western deserts will give advantage merely to the occupants of those regions? Does any one doubt, on the other hand, that such a work will infuse new life and add new vigor and power to our whole Nation? Conversely, can any one doubt that the decay and ruin of an important section of our common country must infallibly weaken that country as a whole?

Great loss is claimed will result to grain and other shippers along the lower San Joaquin river because such a great amount of water has been taken out for irrigation that the barges cannot take away all of this season's output.

Growers in Imperial Valley have found great profit in their vineyards this season.

To Users of Compressed Air Pumping Plants

Clean Skimming Means Good Living

The hog trough is no place to put butter.

Wide awake farmer! Want the cream separator that skims the cleanest. It means more profit—better living. That separator is the Sharples Dairy Tubular—separates that's different.

Sharples Dairy Tubulars have twice the skimming force of any other

separators—skim twice as clean.

Prof. J. L. Thomas, instructor in dairying at the agricultural college of one of the greatest states in the Union, says: "I have just completed a test of your separator. The skimming is the closest I have ever seen—just a trace of fat. I believe the loss to be no greater than one thousandth of one per cent."

That is one reason why you should insist upon having the Tubular. Tubulars are different, in every way, from other separators, and every difference is to your advantage. Write for catalog S-260 and valuable free book, "Business Dairying."

A FRESNO SUMMER DAY.

THE SUN rises over the snowy Sierra peaks a livid coppery red, even while the early morning coolness lingers in the shade, out in the bright sunshine the direct rays are of biting pungency. Yet, no sickening languor creeps over man or animal. The colt in the breaking harness bucks merrily around and around the circle, as the trainer raises his voice in calling out the commands of Whoa!! and Get Up! The teamsters go out whistling, sitting sideways on the work horses; all work in hand is pushed with vigor for no one, except invalids and the idle, seem to mind the heat in Central California. Busy people work hard, eat well and grow fat in the summer time, even the children forget to have measles, scarlet fever and other childish complaints in the wholesome outdoor life they lead.

Cultivating a Cheerful Spirit.

The gong sounds for breakfast calling the family from the garden and piazza while Willie tumbles out of bed to make a hasty toilet. This young beaux whiled away the moonlight hours with a party of young people in the auto. Down he comes with a suppressed yawn saying, "It is hot!" "Yes!" replies the Wise Man, as he unfolds his napkin, "It is going to be a scorcher!" in a tone of melancholy. Both suddenly looked up as Madame rises and holds out her hand saying, "Broken rule, you both are growling over the weather; ten cents each for the poor of Fresno! Any man that must growl when he comes down into a cool dining room, where ice tinkles in the glasses and peaches and cream begins a breakfast of suitable hot weather dishes, should be thankful when he growls not to be worse punished than the price of a cheap cigar."

How I love the heat! The golden sunshine of midsummer. Heat! Glorious heat! The fruit, trees and vines rejoice in the heat. Heat is our best asset as it brings us wealth. Raisins made without heat, are skin and seeds—not dainty jelly—that requires sugar. Sugar is stored up sun-heat in raisins, stored to feed the people of less fortunate lands the gathered sunshine of California.

Alfalfa.

The morning heat strengthens and the horses and cows in the fields seek the shade of the willow trees along the creek. The older cows stand and chew their cuds reflectively and dream of the joys of a useful life of butter making. Into the heifers' minds comes the thought that maybe they will be champions. They all think of the cooling feed of bran and barley brew waiting at milking time and then rising to the present, swiftly switch off that useless fly or two that sits on their sides. They are not hungry! They are not obliged to wander in the sun to fill their stomachs! The horses are happy too, for have they not hay in that outdoor manger? The secret in keeping horses and cows strong and active during hot weather is to feed them enough, really one-half the animals sent out to pasture are not well nourished; they come into the barn when taken up for work with dry, harsh skins, instead of mellow, soft handling. As long as the alfalfa grows thriftily the cattle can live well but as soon as it stops growing

it turns bitter like lettuce and the stock lose their appetites. How do I know this? By tasting it. Alfalfa young and tender makes a delightful salad and is also good as boiled greens like spinach but as soon as it stops growing it ceases to be good.

Trees and Shade.

A tree has a temperature of about 45 degrees; it radiates to a certain degree of coolness in the summer and heat in the winter. In California it is said that in summertime we can hatch eggs in the sun and catch pneumonia in the shade. Trees are easily grown by putting in willow, cottonwood or poplar posts. If a block of fifty posts are put out in the winter, setting them in rows, 12 by 12, and making the rows ten posts long and five posts deep, against the prevailing breeze, a most enjoyable shelter will be made for the stock. These strips of trees add beauty to the landscape and will more than pay for the ground occupied by the firewood produced. Topping them at twelve feet high makes the shade deeper below for the cattle. Where it is not desirable to grow the trees, picturesque brush or palm sheds are built. These are built with trees barked for posts, cross rafted with poles and either brush or palm leaves are put over the top with stones or clods of earth on top to prevent them from blowing away. If a better shed is desired, chicken wire netting is used on the top and the palm leaves wired on as a thatch.

Water.

Abundance of fresh water should be on hand for the animals. The horses at work should be watered once or twice between meals. This often prevents colic, for a horse that comes in from the field too thirsty will often drink too much, when he eats his grain some of the undigested food will be carried into the intestines with the water and remain there to ferment and cause trouble. It is often forgotten that the horse has the smallest stomach of any of the domestic animals, surprisingly small for his size and for the bulky food he eats. Horses are often annoyed while at work with small flies that light on the eyes and if neglected will eat raw spots on the lids. Boracic acid in water should be used to sponge out the dust around the eyes every morning, at noon and at night; if the eyes are already sore, use it more frequently and buy a bit of leather fringe to place over the eyes.

Stables.

After the stables are cleaned out and the floors are well sprinkled with gypsum, close them up to keep cool for the horses coming in warm at noon. Removing the manure promptly and not keeping a lot of idle horses in the barnyard will help greatly to decrease the flies around the barn. I hope to see the time, when there will be no yards around the barns, for they are hard to keep in a sanitary condition, a mere entrance yard paved or asphalted for the stock to pass through to the barns and all the corrals when they stand any length of time, off at a short distance on ground that can be changed every year or two, will aid in suppressing diseases that spread by bacterial infection.

FOR EXCHANGE

A FINE FARM

Near St. Paul, Minn., for good California property. 200 acre land, in the best of condition; large substantial buildings, including four for 70 head cattle and other stock, good, large house, and a creamery building only 11 miles from St. Paul. In the center of three of the best dairy States, with very best facilities, it is an ideal location for a bred cattle farm, a money-making and a fine home. And it is also a to any other farming purpose. An owner has moved here, he will trade a similar ranch in this vicinity, good Los Angeles or nearby property. But I don't want worthless equity, the poor stuff usually offered in and as I am very busy, please do bother me with such offers. This is well worth \$25,000, but \$20,000 would be accepted, and any trade be upon a cash basis, so give cash of yours. For a more valuable property worth the money, I can put Paul and other Middle West property to \$30,000 in addition.

ts to be used as a spray on the cows. These are made from the oil derivatives and are nearer in composition than they are in. I have used several and there is to be little choice between. I can assure you they do pay to use and, so better try one and buy a barrel of it for if once it pays for itself in the increased produced.

s. The little calves suffer more from than any other stock and as are well known to be carriers of se, it may not be going too far to they may at times spread white s. A good airy shed with ned windows, having board ers to close out the rain in win- time, make a good nursery of the les. Have well tamped earth s with six inches of creek sand on in this sand mix a sack or two ound gypsum. Then if you can a patch of "Blue Curly" growing r the mower over it and cure it bedding for the calf house. This curl is a common weed and s up after the grain has been ested over the land. Any old ornian will show it to you. The es will eat some of it, but never seems to hurt them. r the calves are six weeks old, them outdoors at night during summer time and keep them in ouse all day. Spray them daily the same spray used on the

tiny body. Under the shrubbery the sleepy monotones of the hens' voices are heard as they wallow in the dust. The horses and mules at work, plod— plod—slowly down the long, green rows of the vineyard with drooping heads. Nature seems to be holding her breath in the deadly stillness and waiting—waiting.

Sunset.

A soft sound comes to the ear from the deep-toned ranch bell; it gains in strength and volume and beats out its welcome full voiced call. The horses in the plows call out in joy to their mates and quickly are released and away to the welcome grain in their manglers. The cows rise and stretch and slowly file up to the gate for it is milking time. The men joke and talk merrily of their day's experiences as they go in to supper. The sun drops down a golden ball on the horizon. A slow movement of the air—a mere sighing breath in the trees—then a little more breeze and the "gentle sound of the wind in the tree tops" is heard, the "Minnewawa." The sweet melody of the wind in the tree tops is here once more! The birds begin to sing softly in the fading light. The siesta of Nature is over and she awakens refreshed. Slowly the sun sinks and the twilight grows, man and beast rejoice in the grateful coolness of a California summer night.—M. E. Sherman.

THE GENERAL SHAFTER HERD.

W. H. McKittrick, Executor for the W. R. Shafter estate, writes the Cultivator that he has decided to place the famous Shafter herd on sale at the grounds of the State Fair during the week of the coming Fair. This will afford an opportunity to secure some of this noted stock which will be sold at that time without reserve. This herd was gathered together by General Shafter without regard to expense, the only demand being quality. Of course, he had a pride in securing fine looking stock, but the primary question was, "is she a doer as well as a good looker?"

In this herd are some animals originally bred by Shields, Pierce and other of the best breeders and also some by General Shafter himself, and many of them have been prize winners. A detailed record of each animal will be sent on application to W. H. McKittrick, Bakersfield, California. The date of the sale, remember, is Friday, September 13, and the place is the State Fair grounds at Sacramento.

MILK STRAIN SHORTHORNS.

John Lynch, of Petaluma, one of the most enthusiastic breeders of Shorthorns, sends us the photo appearing on this page, of a bunch of young stock in pasture on his ranch. These youngsters are the get of F. Clarence, Orrick and El Capitan. And it is needless to say are all of the celebrated Lynch milk strain of Shorthorns.

They are beauties, and from the looks of the pasture in which they stand, we presume Mr. Lynch has room to produce a lot more like them.

Sonoma County Meadows

Fine Youngsters of the Famous Milk Strain Herd of Shorthorns of John Lynch

PROTECTING COWS FROM FLIES.

The Kansas Station recommends the following as an excellent preparation to prevent flies from bothering cows: Two cakes of laundry soap dissolved in warm water. To this mix one and a half pounds of resin, one-half pint of fish oil and enough water to make three gallons. Add one-half pint of kerosene when ready to use and apply with a brush or spray pump. Each cow should be given about half a pint at an application. It will be necessary to make the application about three times a week till the hair has become coated with resin.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

SHORTAGE OF TEXAS CATTLE.

Word comes from Dallas, reports the South Western Stockman, that the Texas Cattle Raisers' Association, has completed an investigation of the number of cattle at present on Texas ranges with the view of finding whether or not a cattle shortage exists. The result shows that the number of cattle now in the Southwest has decreased from 10 to 60 per cent during the past five years.

The shortage in the Panhandle is placed at 95,000 head in the past five years; in New Mexico the number of cattle has decreased 60 per cent in

that time, and there is not a single herd of aged steers in New Mexico.

Indian reservation cattle have been increasing in numbers, but this is believed to be because the cattlemen are taking advantage of what they think will be the last free grazing year. According to this report, a real cattle shortage exists in the Southwest and in the course of a few years will seriously affect the market.

The Los Angeles Business College has just issued a handsome catalogue replete with valuable information. This superior school commands the consideration of young men and women desiring a commercial education.

The Ornamental Garden

SOME NATIVE MIDSUMMER PLANTS.

AT THE season when cultivated plants are requiring so much irrigation, it is interesting to note the ways of the wild plants that must fend for themselves during the long, dry season. In the valleys of California, summer is the dormant season, for much of the native vegetation. Still a considerable number of plants are active during the summer, finding it easier to resist drought than to compete with the crowded vegetation of the rainy season.

Beautiful Flowers.

Some of these plants begin activity with the winter rains but defer flowering until the summer months. The soap root—of domestic uses in early days—is an interesting example. The large soapy bulb sends up handsome green leaves with the first rains, leaves that grow and work rapidly, supplying the bulb with a new store of food. The leaves cannot survive drought and wither early, but from the underground store-house there springs up during the summer months a much-branched flower cluster several feet in height. The very slender green stems and buds are hardly noticeable until at about four o'clock in the afternoon each day, a few buds on each branch open into fragrant, white, lily-like flower, that by nightfall are dripping with honey and easily secure pollination by night insects.

The tiger lilies of our neighboring canyon bloom in summer but, are not drought resisting, growing only in moist places. One of our Mariposa lilies, rose purple, blotched and densely hairy riethin, blooms rather commonly in early summer on California hillsides. It has the sparse foliage and slender green leaves that are typical of many of our summer plants.

Yucca and Cactus.

The lilaceous yucca are in bloom until the end of July; besides their ample underground store they have the thick, hard-skinned, dagger-tipped leaves still more strikingly adapted to arid regions. Cacti belong to the same type and are generally summer bloomers. The mesembryanthemums and sand verbenas along the beaches have also leaves that store moisture and restrict evaporation and are able to maintain a vigorous summer existence.

A considerable number of attractive wild flowers can be found in canyons and on hillsides, during the summer months. There are several handsome members of the evening primrose family: *Godetia bottae*, with large rose-purple flowers that are sometimes mistaken for Mariposa lilies, is worthy of an established common name. So is its cousin *Clarkia elegans*. The yellow *oenothera* of the beaches and both the yellow and the white evening primrose of sandy wastes, belong to the group, so does the scarlet wild fuchsia (*Zauschneria*) that blooms throughout the summer and autumn. The fuchsia and several other showy summer scarlet flowers, the scarlet larkspur, the scarlet climbing *Pettstenmon*, the Indian pink (*Silene*), the scarlet mimulus along stream beds, have all beautiful adaptations for pollination by humming birds and are much frequented by them.

Several of the summer compositae have attractive flowers. Some of the nightshade family bloom the year

round; *Solanum douglassii* has pretty and very fragrant blue flowers, but the foliage is disagreeable, and the ugly "jimson" weed has huge white flowers that make a fine show in the early morning.

Worthy Extended Use.

This list could be much extended and from it a number of plants well worth cultivating could be selected. We have successfully introduced many plants from similar climates for this purpose, but in time our native plants, the shrubs especially are sure to be more appreciated. Perhaps the most handsome shrub that can flourish on the sunny slope of our

Wild Broom

California foothills throughout the summer is *Rhus laurina*, a shrub easily recognized by the pungent odor of its rather large, thick evergreen leaves. In springtime the leaves on the new shoots are red, but in maturity they are rather deep green and have a fine glossy surface, producing an effect of clean fresh foliage amidst the prevailing dusty gray or sun-scorched underbrush. The growth is rapid. I have seen a few small shrubs grown into a considerable thicket during the last three years and scattered shrubs have attained tree-like proportions.

The California broom—*Lotus glaber*—a lawn shrub or perhaps a woody herb, clothes acres of our foothills. The leaves are few and small but the thickly clustered green stems give a good foliage effect and under favorable conditions the plant flowers the year round. During the past winter and spring the plant grows very luxuriantly on sunny as well as on shaded slopes, but the intense heat of the early days in July scorched the more exposed plants badly. On shaded slopes or with a little irrigation they keep green the year round.

Young plants are easily transplanted. Two important summer plants, the wild buckwheat (*Eriogonum fasciculatum*) and the chamisal (*Adenotorna fasciculatum*) should do well in similar locations; the latter plant would be more likely to require irrigation.

Even the Sunflower.

In our newly laid out towns of California nature often takes a hand in mitigating the ugliness of vacant and unkept waysides. Her best effects are produced with the native sunflower which blooms profusely in summer and spreads rapidly in places that have once been upturned. Sometimes she uses the seeds of hardy exotics. Los Angeles used to contain many fine thickets of castor bean and tree-tobacco that had sprung up spontaneously. Coast towns are likely to be beautiful with the tree manna with its handsome rose colored flowers. There are some tall native compositae with many slender stems and lavender or delicate pink and white flowers open part of the day only, that look well in mass. The dry stalks of the mustard have a charm of their own when sufficiently massed, but they are always a menace of fire.

Tar Weed.

In the valleys of California thousands and thousands of acres of grasslands and other areas vacated by winter vegetation are in summer occupied by various native plants popularly classed as tar weeds. The true tar weeds are compositae with graceful slender stems and pretty yellow flowers; they are more common in interior valleys. In the vicinity of Los Angeles the most common cover of these fields is a low, gray-green very prickly spreading plant (*Eriogonum setigerum*) often known as turkey weed. *Trichostema* is another gray-green plant with very sickly, ill-scented foliage, but the most interesting blue flowers—*Trichostema* curls they are sometimes called—are also common.

Prepared to Fight Their Battle.

Our native summer plants must defend themselves against very hard conditions, against drought, intense heat and light, dust, animal attacks, and so on, hence their many defensive devices. In order to be successful they must be woody, hairy, sticky, resinous, prickly, spiny, ill-scented or otherwise disagreeable. We think they possess are likely to be obscured by wayside dust. But the amount of interest to the observer in plant ways. In the plant world as in human life, the individual is not often both clever and beautiful.

To enjoy midsummer plants in the full grace and beauty of prosperity Californians have only to climb their mountain meadows, but this is another chapter, a chapter read from nature's open book.

ALICE M. DAVIDSON

BERMUDA GRASS.

A writer in the Garden Magazine gives some good things on the Bermuda grass question. He says the best way to combat it is to cut the lawn very close, then rake thoroughly with a good sharp steel rake and cut out every runner that is pulled out. Sow white clover seed and rake lightly. The clover soon grows and hides the Bermuda. Keep very wet in winter and the Bermuda will die out, but clover will grow.

Clean out the weeds and burn them. Get rid of as many seeds as possible. Don't let them fall on the ground to furnish next year's crop. There will be seed enough in the ground from former years without new crop.

The Vegetable Garden

ATTENTION IN THE GARDEN.

the vacation tone pervades in the Cultivator this week, perhaps it should, also, in this department. Whether it does in this department or not, it probably does in the gardens. As a rule the vegetable garden at this season has a faded appearance which isn't attractive, and it has also ceased to be productive.

Such is the case this year this is a good time to plan ahead for next year. That is, are you growing just now nice tomatoes, cabbages, lettuce, melons, egg plant, beans and the hundred and one delicious vegetables and small fruits which add so much to midsummer comforts and to the ease with which the cook gets up her meals.

Yes, a more healthful diet cannot be had than one when there are plenty of vegetables. So plan a little for next spring. Wouldn't nice, if the vegetables look better to you than those wilted ones you have been buying from the Chinaman?

Make a list of those you are now growing for and think over about the ground they will cover. If you have a load or two of manure over that "patch" and wet it if you have the water, then plow or plow in. Let that land lie toward spring, then put in the beds and rows which you can plan while the desire is fresh in your mind.

Probably some of this year's projects have been of such value that they are worth saving. If so, save them and place in an envelope, store in seedbox till planting time.

POISON FOR RODENTS.

We are often asked for a good poison for gophers, squirrels and other pests. Carbon bisulphide is often expensive to use on a large scale. We now note this in Denver and Farm:

A treatment that has proven effective is the use of strychnine potassium cyanide. The formula is as follows: Dissolve three ounces of strychnine and one-half pound of potassium cyanide in one quart of water, then add two quarts of molasses and one teaspoonful of oil of wintergreen. Stir. Then place one bushel of wheat in a tight receptacle and pour the solution over it.

It should then be well stirred while the wheat is being sprinkled into the receptacle. Use four pounds of finely ground meal. The molasses renders the mixture adhesive, so that it will cling to the grains of wheat. The object of using the cornmeal is to absorb the superfluous liquid or syrup and make the grains of wheat to contain a larger amount of poison. Care should be taken that the proper proportions are used; that the mixture of potassium and strychnine is completely dissolved; that no water and syrup are used than the recipe specifies, as one bushel of wheat will not take up and carry more than this amount of liquid.

After the liquid has been poured over the wheat the dose should be stirred until all of the wheat has been in contact with the syrup and the poison is equally distributed throughout the whole mass. It should be the same day that it is prepared in order to obtain best results. The way to apply this is to take some

of the poisoned wheat in a tin pail and sprinkle about a tablespoonful of it in and around each hole. Do not leave it in lumps or bunches, as cattle or other stock might possibly eat it, although our experience shows that the danger from this is not great, as cattle have ranged without injury over the towns thus treated.

It is best to take a strip about two rods wide, set stakes at convenient intervals to avoid going over the same ground twice and also avoid missing any of the holes. When more than one person is operating the stakes may be set to indicate the ground gone over, the operators keeping about two rods apart and changing the stakes over to the outside as the one next to the poisoned ground comes to them. The poison seems to do its work within forty-eight hours.

Of course, it goes without saying, that poultry must be kept from the fields where this is used.

RICH SOIL—MORE PROTEIN.

In a bulletin of the Minnesota Station, influence of soil composition and fertilizers is thus spoken of:

The protein content and the composition of the dry matter of a list of forage crops and forage-crop combinations are given and briefly discussed. The dry matter and protein content of corn fodder at different stages of growth are shown in a table, as is also the composition of silage and that of corn smut.

It was found that corn fodder, timothy hay, rape, pasture grass and hay crops from mixed grasses were materially influenced in composition by the use of farm manures. Less fiber and from 25 to 30 per cent more protein were secured on soils in a good state of fertility than on similar soils low in plant food. Leguminous crops like clover, alfalfa and peas did not appear to be as susceptible to the influence of fertilizers in increasing the protein content as crops like corn fodder and rape.

An examination of a number of samples of clover, alfalfa, pea, bean and millet seeds of known quality showed each sample to contain two distinct types of seed, one of high and the other of low protein content. The high protein seeds were darker in color and more corneous in character than the low protein seeds. It is believed that by selecting seeds on this basis, forage crops of the maximum protein content may be produced in the same way as has been accomplished with wheat and corn.

Analysis of 18 samples of the more common weeds showed that many of them assimilate large amounts of soil nitrogen, and it was found that when they were harvested with grain crops the amount of nitrogen removed by them from the soil was often larger than that contained in the grain.

The dry matter of nearly matured rape was found to contain about the same amount of protein as clover. Rye fodder, prairie hay and millet showed about the same general composition in feeding value as timothy hay produced under similar conditions and cut at the same stage of growth. Pasture grass and hay from mixed grass seeds and some clover contained more nutrients, especially when grown on well cultivated and manured land, than timothy, red top or blue grass alone.

A Life Income from Land Investment

7 per cent. guaranteed, payable semi-annually. No risks. Sugar plantations pay 33 1-3 and more when in full cultivation. One planting good for dozen years.

We own 9489 acres of richest land in State of Vera Cruz, Mexico, near Tampico. Sell you one to a hundred acres and contract to cultivate for fifty years and pay you the profit.

Best Crop Profit in the World

No other crop in the world as rich or as certain. Our plan is simple and safe. Your money does the work for you.

We Do All the Work—You Stay at Home and Enjoy the Profit

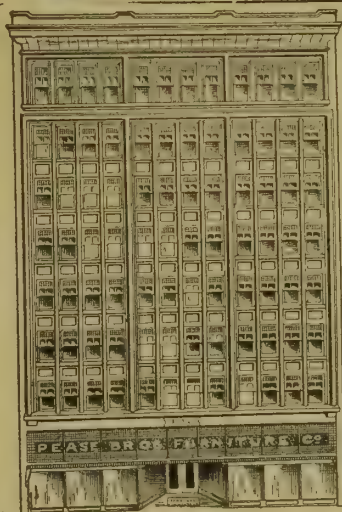

It will pay you to know more of our sugar plantation profit-sharing plan. George Gould, speaking of this section, says: "The great Southwest will surprise the world in the next ten years with its development." Let us tell you more.

When writing advertisers, mention Cultivator

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

California Horticulturally

SACRAMENTO AS A SUMMER RESORT.

IT is probably a heritage from our old nomadic ancestors which impels mankind with the desire for a change of location. Being somewhere, we naturally wish to be somewhere else. This instinctive desire for change becomes intensified with the opening of the spring months and reaches its culmination in the summer. This makes business for railroads and other transportation companies and is the life of the hotels, especially the country hotels, and for some people is a good thing. Yet, after all, the great pleasure to be derived from a summer outing is in getting home again, in the enjoyment of which we soon forget all the discomforts we have endured and cajole ourselves into the belief that we have had a really delightful time.

People from the mountains come to the valleys, people in the valleys long for the mountains, people on the coast seek the interior and those in the interior long for the cool breezes of the coast, anything different from what they have.

Why Leave Sacramento Valley.

Except for this instinctive desire for that which they have not, we cannot understand why any one should wish to leave his home in the Sacramento Valley for a change. Nature here has been lavish of good things and, while there are occasional warm days, these are rare and the heat is never excessive. In fact, we have here all that is usually sought in the summer resorts, and do not have to go from home to enjoy it, but it is with us all the time and we have become so accustomed to it that we cannot appreciate it. A change is, therefore, sometimes a good thing, as it enables us to come back and really enjoy what we have by contrast.

From Sacramento to Redding, and beyond to Sissons, the whole valley is intersected with beautiful streams filled with many varieties of fish, among which the different species of trout are abundant. These give unlimited chances for sport in fishing, boating and swimming, and game birds, which are found here in unlimited numbers, make it the sportsman's paradise. The banks of these streams are usually lined with trees and shrubs, while the ground is carpeted with softest grass. For those who enjoy camping in the open, nothing better can be found, while for picnicking the whole length of the State can offer nothing better. Leaving the lower valleys, we reach the foothills and here come to waterfalls, gushing mountain streams, shady nooks and cosy dells. A little higher, and the pines break upon us with all their grandeur, while the rolling hills, verdure-laden, furnish the lover of nature a picture unexcelled elsewhere on earth. All these attractions are within a few miles from any point in the valley, and many of them directly at our back door. They are appreciated, too, not by those who see them every day, but by those who come from a distance to see and enjoy them.

Don't Let Familiarity Breed Contempt.

Even the city of Sacramento has many claims on the public as a summer resort, and did the people who live there fully realize the advantages they enjoy over most localities in soil, climate and scenic surroundings, and would only make the best of them and let the outside world know what they have, there is no reason why the Capital city should

not become one of the pleasure resorts of the United States, not alone for the summer, but also for the winter. During the past summer, while the East has been sweltering, hundreds of people have suffered and died from the excessive heat, there has not been an uncomfortably warm day, while the evenings are perfect with their cool, balmy air, and the nights are always cool enough to guarantee refreshing sleep. It is a city of gardens, ever green, for abundance of moisture in the summer and the mildness of the winters assure perpetually green lawns and blooming shrubs. In fact, the city is like a vast park with residences scattered through it, while numerous well-kept plazas afford breaks in the settled portions and furnish playgrounds for the children. Other attractions here are the great river which bounds it on the west and the south—the Sacramento—while another river, the American, lies on the north. Here are chances for the pleasure seeker that few points offer, and which people are now learning to appreciate. A few miles away are the foothills and a short distance beyond the high Sierra Nevada range, and all within a few miles of the State Capitol. The opportunities for pleasure here are unlimited, and it is only a question of time, and a very short time at that, before they will be fully appreciated. The older settlers have lived among their grand surroundings so long that they have become familiar with them and it is said that familiarity breeds contempt. Certain it is that familiarity breeds indifference, but Sacramento is rapidly growing and people are coming in, to whom all these things are new, strange and pleasant. These are already making known the claims of our beautiful State capital upon the public attention, and before long, while many of the inhabitants may leave for a short change in the summer, many, many more will visit Sacramento to spend and enjoy their summer outing.—John Isaacs.

HOW PARCELS MAIL PACKAGES ARE HANDLED.

Consul-General R. P. Skinner, of Marseilles calls attention to the parcels post in France, writing:

It is unfortunate that, although the United States Government has parcel post conventions with twenty-nine different political divisions, including Germany, Norway, Belgium and Great Britain, no such arrangement has been made with France. From this country, on the other hand, it is possible to send parcels to almost every country in the world, except the United States, to weigh varying from 6.61 to 11.02 pounds. Parcels for domestic delivery are similarly accepted upon the following terms:

Three kilos or 6.61 pounds, 12 or 15 cents, dependent upon delivery at railroad station or domicile; 6.61 to 11.02 pounds, 16 to 21 cents; 11.02 to 22.04 pounds, 25 or 30 cents.

Contrary to popular opinion in the United States, parcels sent by post in this manner are not deposited at the various postoffices, but are accepted at the railway stations, city railway offices, and offices of the subsidize steamship lines, acting as agents for the State.

WANTS IT TO FOLLOW TO OHIO

I will attend to a long-neglected duty by sending pay for your good paper. I am thinking of going to Ohio, but will want your paper there.—MR. EMILY SHAW, Escondido.

With the Citrus Growers

IRRIGATION OF GROVES.

old question of irrigation is new with the orange grower, though methods change but when a system is once established new things come to light and things are new to the new grower.

and Practice.

a well established fact that irrigation in any place does not always

FUMIGATION vs. SPRAYING.

During the many years in which the heated controversy over the relative value of spraying and fumigating, the Pomona Experiment Station had experience with the two methods and found that spraying as done there by one of the best operators in the country was a complete failure. In fact, it was worse than a failure for the reason that it not only did not exterminate the scale but in-

furrows down in the bottoms and practically filled the furrows with loose dirt without disturbing the soil at any other place.

MARKET OPENING FOR AMERICAN ORANGES.

Consul Chapman Coleman, of Roubaix, calls attention in the following report to the prospective market for citrus fruit:

Our excellent California and Florida oranges are not in evidence in the markets of this part of France, although they should, it would seem,

More than one-fourth of the lumber cut each year in the United States is made into boxes, crates, barrels and other packages. A great majority of the lumber thus employed is destroyed after the box or package has been used but once. This has led to the too frequent use of boxes of inferior quality, and one of the greatest drawbacks to American trade abroad is that the goods are too often shipped in cases that are not strong enough to stand the trip half-way around the world.—Anaheim Gazette.

A Fruiting Spray of the Eureka Lemon at the San Dimas Nurseries

but on theoretical lines. We are at that we must irrigate in deep furrows so as to get the water deep into the soil and keep the surface dry as to obviate evaporation from the surface that will become wet. The deep furrow system is not used in any kind of soil. It is a thing to strive for in most soils, but few of them are used in any kind of soil. It is a furrow which will not run to the top. We are told that we must not allow any water to run from the lower end of the furrow. This is a thing to strive for in most of us do, but in practice, we will sometimes get way from the most careful irrigator. It is simply within the ability of the best operator to irrigate any considerable area and have the water so evenly distributed as not to lose any. It is that a small stream that will reach the lower end will soak up much water as when part runs off, but in order to make the water do so, every part of the day, it might, would cost more than a waste of water is worth. The water may be set so as to just run off in the morning, and if it is a warm day it will not reach the end by several trees. If it is used so as to give no waste during the day, it will run off at night in considerable volume. The small operator may be able to successfully control the flow for the different periods but the larger grower can only approximate it. The most economical method is to have a strip of alfalfa at the lower end for the family or irrigate the lower ends of the furrows by the check system. On terraced and steep slopes where trees are planted on contour lines this can be done.

jured the trees. The operator endeavored to do a most thorough job and overdid the work, soaking the ground with the emulsion and got too much on the foliage and bark. Some of the trees which had up to that time been green and vigorous turned yellow and dropped most of the leaves and never did fully recover. The company which did the spraying was promised a testimonial. The company never received a testimonial.

There may have been much spraying done which did not damage the trees, but we do not know of any orange groves which have been sprayed year after year that are not more or less injured. The fact that there is danger in the operation is enough to condemn it. There are many conditions which seem to enter into the successful operation of spraying and failure to observe any one of them may prove a great injury to a grove.

We found that it was impossible to reach all of the scale as, for instance, on the stems of clusters of oranges. In all such places scale were found in abundance. The following season the trees had an abundance of scale on them and fumigation was necessary.

A USEFUL TOOL.

We recently saw in a Redlands grove an attachment behind a cultivator that did excellent work. It was a wagon tire bent in the shape of the letter W and fastened so as to drag by the three upper points of the W. It was so attached that when the horses walked between the irrigation furrows, the two lower points of the W passed over the furrows. This dragged the ridges on each side of the

find ready sale here at certain seasons, when a good quality of oranges of French and other European origin has not yet matured. No oranges are marketed here in the summer and autumn. With the beginning of winter they first appear, but are sour and of poor quality, generally, and not until March are good ones to be had.

Certain varieties of California and Florida oranges mature as early as September. The opportune time for the sale here of this fruit, of which such abundant crops are now grown in the United States, would be during the six months from September to March; and the greater advantage would inure to the earliest practicable shipments of a good article. This opinion is based on the assumption that the fruit can be gotten here in good condition, and it is confidently believed it can be, and that it is offered for sale at a fair price.

A few drops of lemon juice added to the water in which rice is boiled will whiten the kernels.

VACATION ON THE FARM.

How many farmers take a vacation? How many understand the value of a few days recreation for the overworked wife, sons and daughters? When the harvest time is over, when the fruit and vegetable crops are marketed, if the tired household would pack the wagon with camping paraphernalia and go away for a week or so to some healthful canyon, to the beach, or to some mountain resort, and there forget all about the worry of life in red and pleasure-seeking, how beneficial to all concerned would such a vacation prove.

The farmer needs variety as much as the professional or business man. His family needs it too, for the daily grind of the farm robs it of much of its genuine satisfaction and worries wife and children to an unbearable extent.

A few days spent under changed surroundings recuperates the wasted energies, reincarnates the ambition of the family and brings it back to labor with a zest which nothing else can give.

Time thus spent is money earned in the end, for it creates better health conditions and inspires renewed attachment for the home and things which belong to it.

Take a few days away from your daily grind, Cultivator readers, get into closer touch with nature's health restorer, the mountain air, or the sea breezes, and our word for it you will be happier, live longer and have less trouble in contenting your sons and daughters on the farm.

THE WHITE FLY CAMPAIGN.

Realizing the extreme gravity of the situation as it relates to the invasion of California by the White Fly and the necessity for radical action on the part of the State authorities, viz., the Horticultural Commission and the Entomological Department of the State University, the Cultivator last week addressed letters to the Hon. Elwood Cooper, asking him what action the Horticultural Commission is going to take to eradicate the dreaded pest from California. At the same time a letter was addressed to Prof. Wickson acting director of the Agricultural College of the State University propounding in substance the same questions as were directed to Commissioner Cooper. Both these officials have made reply and these appear in the following columns. It is important to note that everything possible is being done by the State authorities to control the spread of the White Fly and to eradicate it entirely from California.

I write at once upon receipt of yours of Friday, which has just reached me.

I have never heard any proposition that the White Fly work shall be sought for the University. Prof. Woodworth has said what he believes about the inadequacy of the effort made at Marysville, openly and above board. It is his duty to do that and the citrus interest must judge whether his position is well taken or not. He has also said freely what he thinks ought to be the character of the work which the State should undertake to stamp out this pest if possible. It is fortunate that the insect has appeared so far in two rather isolated places and is, therefore, perhaps capable of being stamped out if the right kind of work should be done. It is Prof. Woodworth's duty to give the people advice as to the situation and what it requires.

I am not aware that anything has been said and certainly nothing has been printed by us which insists or even suggests that this work should be given to the University. That is a matter which the Governor of the State must determine and I suppose he will be influenced by the collective judgment of the citrus interest which is threatened. If the demand is that the University shall undertake the problem it will probably not decline if adequate funds are furnished. If the Governor places it in the hands of the Horticultural Commissioners, the attitude of this department of the University will be just as it has been, viz.: to ascertain and state facts and to express opinions, so that the great citrus interest may know just what is being done and enable it to judge of its efficiency. We can have but one standard of work and that is adequacy and efficiency. We are willing to co-operate along that line with any agency. The Governor of the State may constitute and we are willing to be corrected and criticised along that line just as we shall expect to correct and criticise others. Anyone who suggests that the attitude of the University toward this undertaking is prompted by selfishness or by personal considerations, simply does not at all appreciate the menace which now overhangs our citrus interest nor the character of the work which must be done to avert it. The situation is altogether too grave to be trifled with and those who are trying to impeach the University experts by charges of ambition or selfishness have no conception of the seriousness of the problem nor of the attitude of mind which should exist towards it.—Very sincerely, E. J. Wickson.

I am in receipt of your favor of the 16th, inst., asking for information relative to the White Fly, its present area, work already done by the State Horticultural Commission and measures which should be taken for its future control.

I take pleasure in giving you this information, as I fully realize the danger from this pest, and the necessity for its control, but at the same time I would strenuously guard against encouraging any feeling of panic which some alarmists are endeavoring to raise on account of it.

The first information received at my office relative to this pest, was in a letter from Mr. George W. Harney, County Horticultural Commissioner of Yuba county, dated May 12th, which was accompanied with specimens of the supposed White Fly. Immediately upon its receipt Mr. Edward M. Ehrhorn, the entomologist of the State Commission, was despatched to ascertain how great the danger was, to obtain further specimens and to determine whether it was true *Aleyrodes citri*.

We have a number of *Aleyrodes* in California none of which are very serious, and we hoped that this might prove to be one of them, as the adults of the family very much resemble each other, and as this was a new species in our State. While we feared the worst, we hoped for the best, and in order to be certain, specimens were sent to experts at Washington who at once pronounced it true *Aleyrodes citri*. In the meantime, in order to be ready for action when the identification was complete, agents from this commission were dispatched to Marysville, with instructions to make a thorough investigation in regard to the area infested, the plants affected, the number to be treated and such other details as would be needed in active work. As soon as positive information was received, and there was

no longer doubt as to the nature of the pest, active work was commenced. There was but one thing to do, and this was suggested by Prof. Woodworth, of the State University, whose views were in perfect accord with my own at that time and that was that all infested trees, and such might harbor the fly, should be defoliated.

Of course, there were difficulties to be met and overcome. Where there are several thousand people to deal with, and it is proposed to destroy their property for the public good, it requires much diplomacy sometime, and in a few cases coercion. The State Commission has no authority, under our law, to destroy any property cannot order any tree rooted out or burned, though the general impression seems to be that it possesses despotic powers. It has the power to quarantine an infested section, but can go further; we were, therefore, compelled to go through the County Board of Horticulture, we found in Mr. Harney, the active member of the Board, an active and willing worker and his efforts we owe much for the success of the work, which was carried on under directions from myself, through agents of this commission. We have been kept constantly in the field, so that as there was any active work to be done, and have not been without one or more representatives in the infested district, except for a day or two at a time, when duty called our men away only to return at the earliest moment.

Now, in relation to the thoroughness of work which has been done, I quote the following report from Marysville, dated July 15th.

"The White Fly pest practically has been terminated in Marysville. No tree or plant known to furnish food for the fly remains in possession of its foliage, so far as Horticultural Commissioner Harney has ascertained.

"A systematic house to house inspection has today to find any stray leaves on citrus trees.

"Harney estimates that 7000 trees and plants have been denuded or destroyed in the city."

When it is considered that within a period of two months, we have identified this pest, met and overcome all the objections raised by property owners against destroying their trees, carried through and won cases in the courts, I do not think any unprejudiced person will claim that we have lost time in the work, and I will assert that unless he possessed a magician's wand and could accomplish the work by the hocus-pocus process no living man could have been more expeditious.

And now in regard to the thoroughness of work, we have the evidence of Prof. Warren Clark. Prof. Clark has been connected with the University of California for many years and well known for his judgment and reliability. For several years past he has been stationed in Florida where he has had opportunities of studying the White Fly, and is hence somewhat of an authority on the subject.

"I have been in the State only six or seven months and having had considerable experience with the Florida White Fly in the Southern States, naturally I was interested in conditions in Marysville. First I found what had been well known some time ago, that the pest in Marysville is genuine Florida fly, and I next found—and I am glad to find—that the State Board of Horticulture had adopted the best policy of extermination known—the removal of the food of the insect at this stage of its life.

"The State Horticultural Commission has done business in grand shape. The orange, persimmon and other trees are being literally skinned of foliage—absolutely cleared—and this is necessary if the fly is to be destroyed."

I do not think that any stronger indorsement of the work of this commission could be asked and it will appeal to every man who has not ulterior motive in discrediting it.

The White Fly is not spreading. It is confined, so far, to two points of infestation, the original, and it has never spread out of the locality in which it was first introduced. It was brought into Marysville on stock smuggled by the inspectors years ago and so far is confined within the limits of that city. The second point of infestation is near Bakersfield where it was introduced by W. S. Tevis on Florida stock some two years ago and here it is confined to about hundred trees and has not spread out of original area. These facts argue strongly against the efforts of those interested parties who are now endeavoring to create a panic in Southern California, and would have the citrus growers believe that the discovery of the White Fly at Marysville was a Pandora's box, out of which untold ills were about to pour upon them.

There is danger from the White Fly, great danger; were there not, the efforts made by the Commission to stay its spread would be unnecessary, but when we consider that it has been known to be in Marysville for the past three years and has not spread outside of that town, it is likely that it will take a sudden jump at the date of over five hundred miles to reach the orange groves of Southern California. Unless spread is checked, it will undoubtedly reach them at some time, and when it does, will cause great damage, but while it has been at Bakersfield for two years or more and at Marysville for a much longer period, we may certainly give ourselves no uneasiness if it is not entirely eradicated within twenty-four hours.

With regard to future work, so far as I have the shaping of it, the pest will be met with constant vigilance. We have got first, to get it under control, which our work has done so far. Then watch it carefully and see that there is no further outbreak. A system of the most vigorous

tion must be maintained and every plant which it appears be immediately destroyed. Known means to check its spread must be and this work should be kept up until we every reasonable assurance that there is not tige of the pest left in our State. This is plan of action now being worked out by the Horticultural Commission. In the mean- the citrus growers of California may rest ed that no effort is being spared to eradi- his pest, that it is now under full control, hat there is no more danger of its appear- in the orange sections, and perhaps not so than if it were still confined to Florida.

Ellwood Cooper.

are in receipt of the following from A. G. Hall, Secretary and General Manager of the Protective League:

ant to thank you for your timely article, "To Get Busy," in your issue of August I was at Marysville before the defoliating, and have kept in close touch with all that been done toward the eradication of the White a California. There were serious defects in

the Marysville case, the most serious one, however, was the time lost before the actual work began, allowing the fly to take wing before the cutting back was fully completed. This was partially caused by the proposed resistance to the order to cut back trees. It took a great deal of discussion to show the people of Marysville that the cutting back of orange trees did not ruin them, and they will soon be surprised to learn that in most cases the cutting back will prove an actual benefit, outside of any consideration of the pest to be destroyed.

Brush was thrown in the streets for the city to haul away, but experiments made on the ground tended to show that eggs and larvae were killed on leaves drying on the brush, before the brush was actually destroyed.

One locally noted gun fighter, after threatening the agent of the State with dire vengeance, was told that the notice had been regularly served, and that his trees must be cut at once; with an oath he declared the State should not cut them, and with a saw proceeded to do the work himself. His haste and anger furnished the picture, shown in Circular 32, as a case of improper, careless work.

No one knows, who was not in the midst of the work at Marysville, the rebuff and trials of those who were obliged to enforce the order for defoliating, and instead of criticism, they should have had the support of all, and doubtless would if the practical part of the work had received as much attention as the entomological feature.

Cutting and burning were necessary at Marysville because the pest was on many food plants and some Privet hedges—and citrus trees generally throughout the city.

The Bakersfield incident is practically closed, before it began, so to speak; a very different proposition from the one at Marysville. "Practical hard-headed men" had a hand in it and one of the best of them, Mr. Carnes, had charge of the work and arranged the programme.

I have not written with a view to criticise in mind, but have mentioned two or three features of the difficulties of the past to show you how well timed your article was.

The State by its appropriations supports the Horticultural Commission, as it does the State University, and the State is entitled to the best efforts of both.—A.G. Kendall, Sec'y & Mgr. Citrus Protective League.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed management, disease and its prevention will be answered through these columns.

CONVENIENT SCRATCHING PEN.

IN THIS issue we are going to give our readers some labor-saving hints for the poultry yard. We always insist that if we arrange for our fowls to be comfortable and contented and yet make them work for what they get we will have better results; at the same time we will enjoy our work in the poultry yard better and feel that the birds are not a burden, but a comfort.

All who have bred and handled poultry for any considerable time know that shade and a scratching shed are two things that are a necessity—for comfort and profit. We are going to give a description and directions for making one of the best scratching sheds that we have seen. We got the idea from a similar one used on

duck. If you use a good heavy for cover or roof and keep your on ground that is well drained will find that it can be used all with success.

One poultryman said on seeing shed that it was a capital idea, but could not use it as his yards situated on a steep hillside, that litter would work down to one and over the board. Of course is a feature that will have to be considered with many poultrymen to overcome this, all we have to put a floor in our shed, level it put in our litter, and it is ready use.

AROUND THE YARDS.

Feed a variety of food. Birds joy a change as well as we do.

A Cheap Scratching Pen for Hot Weather

a poultry ranch in Southern California, but the shed can be used in almost any climate, unless in the extreme cold sections. Even there it could be used to a good advantage most of the year.

We are glad to give a picture made from a line drawing and hope it will assist some who wish to make one.

Cheap and Easy.

The shed is very simple, cheap and easy to make, can be moved from one part of the run to another when it becomes necessary. Serves a "duo" purpose of shade and shed. You will be surprised to see how kindly the birds take to it, and how contented they will work for the dainty morsels to be found in the litter. One poultryman told us that he kept a plot of ground worked nice and fallow and into this fresh earth he threw a few handfuls of grain each morning and raked it in, then let the fowls scratch for it through the day. He liked the plan fully as well during the dry season as litter, and as our shed has no floor in it we would suggest that those who find litter hard to get to give this plan a trial.

Description and Size.

Our shed can be any size desired, to suit space, but we give as a model one ten feet square which we have found convenient. It is made by taking four boards one inch by 12 inches—ten feet long, nailed together at corners, using as corner posts either two by three or two by four—two feet long. In center on opposite sides tack a two by three, four feet high and to these posts nail a one by three board edgewise to support your canvas.

Now your shed is ready for your roof which can be of canvas or

Don't dose your fowls to keep them well; clean quarters fresh air wholesome food is better "dopes."

It takes about three months grow a broiler.

It will require seven pounds skimmed milk to equal one pound lean beef for flesh-forming quality.

A hen was cackling long and loud. Said I to her: "How strange y song." Said she: "'Tis scarce a song; fact, It's just a lay, to be eggs-act."

After a hen is three years old becomes unprofitable as an egg producer, and is rather tough for use.

One dollar per head is the average cost of keeping a fowl a year, and same amount is a fair estimate of profits.

Many have again learned that best way to manage a sitting hen as with a woman, let her have own way.

A nail keg filled about one-third full of dirt, then make a nest on this is good for the egg-eating hen as is too small for her to stand in a peck the egg hard enough to break it, and it is too deep to stand on the edge to reach the egg. We have known this to baffle some of the worst cases of egg eaters.

Fleas.

Please tell me through the Cultivator what to do for my hens. I find they are covered with fleas. Will they in rainy season have any effect on them?—Mrs. H. B., Fresno.

relief of birds afflicted a good application of carbolic salve or lard sulphur. But you will be annoyed until you rid your houses and of them. This can be done by painting the houses with an emulsion of stillate and crude carbolic acid, solution of sulphuric acid about tablespoons to one gallon of water; spray well in houses and about twice or three times a week for two or three weeks, care be taken to keep it from the clothes and hands.

FEEDERS OR HOPPER FEEDING.

Many farmers through the Central Middle West are using the self feeder for their cattle. Although we have used a self feeder for poultry we came to California, during the last three years we have made a study of self feeders and hopper feeders. We have seen many kinds of self feeders put on the market, good, bad and indifferent. We have made up our mind that hopper feeding is best both for poultry and poultrymen. It has been pretty well demonstrated that to feed a well balanced ration in a self feeder is profitable and practical for the

Poultry Feeder

hens. And, it has many advantages over the old way of feeding. Many of our readers are already using the self feeder and to them this is not of advantage, unless it be the style of hopper; we have tried and have seen many hoppers that did not serve the purpose for which they were intended. No hopper is practical that wastes feed, or is so constructed that the hens can throw the feed out on the ground.

and Feeder.

There are many good and inexpensive feeders sold by poultrymen. We will pay for ourselves in a short time. One that we like especially can be bought for 75 cents or less and made with little work in case you don't care to buy.

To make a feeder take a board ten inches wide; from this cut one piece eight inches long for bottom, two pieces eight inches long for ends and support of. Nail bottom to end of the four inches from end; now saw the end, shape of letter A. Take two pieces ten inches wide and 30 inches long nail in shape of trough or V, with this upside down over A-shaped board for roof; now take two pieces eight inches by two feet nail on for sides and your feeder is ready.

Give as our model the two-foot feeder but it can be made any length. A partition can be put in the feeder for different kinds of food, such as charcoal, etc.

WANTS IT STILL BETTER.

Enclose \$2 for paper to January, 1908. I thank you very much for the information contained in The Cultivator. I hope it will continue to come and that it will be still better in the future.—H. C. BERRY, Rainier, Wash.

ORPINGTON CLUB CATALOGUE.

The Orpington Club of Southern California is at work on the club catalogue or year book which they hope to have in the hands of the members soon. The objects of this club are to promote the interests of this handsome and most useful breed of poultry. It need not here be enumerated why breeders of poultry should become club members. Poultrymen generally too well understand the benefits to be derived from such an association. If you are an Orpington breeder and not a member, you should join as the club needs your help. The membership fee is one dollar. Write to the Secretary, A. G. Goodacre, Compton, Cal., for information and by-laws.

AMERICAN BUFF WYANDOTTE CLUB.

The American Buff Wyandotte Club is about to issue its annual catalogue and extends to all breeders an earnest invitation to become members so their names will appear in the catalogue and as a special inducement offers a fully paid up membership to October 1, 1908 for \$1.00.

The club will offer special ribbons at any show whose secretary will ask

for them. Members are requested to ask for the ribbons for any show at which they are intending to exhibit. Send in the names and addresses of show secretaries early so these specials can be listed in the premium lists of the shows.

Correspond at once with the Secretary, Henry R. Ingalls, Greenville, N. Y.

FATTENING MARKET CHICKS.

It is generally conceded that it is a good plan to give the chicks only as much food as they will eat at one meal with keen relish. While this is true, generally speaking, there will be no harm in having a feed trough in a cool, shady place, filled every other day with cracked corn and wheat, so that the chicks that are ten weeks old or more may have access to it at will if they are to be fattened for market. They will not partake of it too freely. Often the heat will be just to their liking and precisely what they need to form a properly balanced ration for the day. The dust bath for the flock is especially needed, and freshly-spaded earth, where there is ample shade also, will afford the flock beneficial enjoyment. Lice kill more chicks than all other causes combined. Dust and grease are the natural remedies in checking the vermin that infest poultry. During the warm months it requires effort and every method known to overcome vermin in the poultry yard. Neglect quickly tells, and increases the trouble, making more than twice the work to do which should have been done properly at first.—Coleman's Rural.

To mend broken china, use a cement made by stirring plaster of paris into the white of an egg.

Egg-More

for

Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials, and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

Gas and Electricity for the Farm Home

"DON'T BLOW out the gas," used to be a familiar sign in the sleeping chambers of such hotels as catered to the needs of the little-traveled farmer. It surely was a necessary warning. Who can say how many lives have been saved by heeding the advice of the thoughtful boniface. The many lost by disregarding it are recorded in the daily press.

But those times are passing away. Not only is the modern farmer familiar with gas—and by gas we don't mean the kind dispensed by the lightning rod man back East—but he is also familiar with gas' younger brother, electricity. When we were young so much could not be said. The first electric light we ever saw is in our memory still.

Yanked the "Dofunny" Off.

Father had taken us to town to consult the doctor about some childhood ailment and it was necessary to remain a night away from home. And, of course we stopped at the best hotel—and the only one—the county seat afforded. When bedtime came we found our room illuminated by a new-fangled "dofunny" hanging from the end of a wire. After much investigation it was accepted as an electric light. We were used to sleeping in the dark and didn't want a think like that glaring at us all night long. But how to put it out—that was the question. (The switch was behind the door and we didn't see it.) Blowing did no good and the writer, with youthful ardor, was about to suggest thumping it with a bed slat, when brave old Dad lost all patience and gingerly grasping the cord with both hands, gave a powerful jerk and pulled the whole contraption out of the ceiling. The light was out and the landlord was put out.

A Digression.

But as we said, the farmer knows more now. He doesn't do as his father did—unless that is still the better way. Farming is now a science—as everything else seems to be. Not only must the farmer know that seeds grow when he plants them, but he must know why they grow. Not only must he know what work his farm requires, but he must know how to do that work with the least possible expenditure of time, money and labor. And that's where science and scientific knowledge help him. Help him not only to make his work easier, but to make more money.

The old horse-power was used for everything not so long ago, then the portable steam engine did the work, but now the constantly improving gasoline engine has usurped the place of both and is today the farmers' tried and true friend.

We know one farmer who used to keep a Jap, at a total cost in board and wages of \$40 per month, to help him care for his five-acre ranch and poultry farm. Eventually he installed a four-horse-power gasoline engine to grind chick feed, alfalfa meal, meat scraps, bones and corn and pump the water used in irrigating. Besides that, it ran the washing machine, the wringer and the cream separator, relieving his wife of the drudgery and doing away with the necessity for the Jap's services, and all at an average cost of \$6 per month, enabling our friend to save \$400 a year more than when he employed a man.

Back to the Subject.

The reader may think we have

wandered from our subject, gas and electricity, in thus exploiting the advantages of the gasoline engine, but it must be remembered that the generation of electricity on the small scale suitable for the farmer's needs, requires that the motive power be of the simplest and most economical kind and this the gasoline engine supplies.

In discussing the use of electricity on the farm, we wish to refer more particularly to the many advantages and conveniences its installation would bring to our wives and daughters, who are, in many instances, entirely without the labor-saving devices within reach of their city sisters. This is so, not because the farmer is less thoughtful of the comfort and welfare of his family than the city man, but because the majority have not realized the opportunities placed within their reach by the gas machine, gasoline engines and electrical contrivances now on the market.

A Defect Overcome.

The chief objection formerly urged against the production of electricity by small engines was the annoying flicker of the lights caused by the variable speed at which the dynamo was driven, but manufacturers now claim to have entirely overcome this defect by the use of governors on their engines, thus maintaining the uniform speed so necessary to a perfect light.

A prominent poultryman of Santa Barbara eliminated this difficulty by feeding the electricity from the dynamo into the storage battery of his electric automobile, thence into his house. One objection to this scheme was that when the auto was in use he could have no lights in his home. He informs us that he has discarded this method as being unsatisfactory.

The First Question.

The cost of installation of an electric plant for the home is naturally the first consideration. Below we give figures showing the approximate cost of a plant for a house of eight rooms and giving power enough to furnish from twenty-five to fifty lights. The first requisite is a good engine of at least five-horse power. It is doubtful if a smaller engine can be used to advantage. Where the farmer already possesses an engine of suitable size, the cost of the remainder of his plant is merely nominal, and may be summed up as follows: A two-kilowatt dynamo and the necessary wiring, from \$75 to \$100. This amount will include, in most cases, the fixtures and lamps ready to burn.

This All Looks Good.

If not more than twenty or twenty-five lights are installed, there will be enough power to have electric fans, toasters which toast both sides of the bread at once and which may be operated on the dining table, hot plates, to brew the tea and coffee, electric ovens and cooking apparatus of all kinds, and in addition portable heaters of attractive design may be used by simply connecting to an electric socket. A small motor may be attached to the sewing machine, washing machine, churn, cream separator, grindstone, etc. Even the clothes may be ironed by electricity.

The fuel oil to operate the engine will cost about seven cents per hour. By having this power installed water under pressure may be piped throughout the home without additional cost

for power, thus insuring adequate fire protection.

Where the rancher does not already possess an up-to-date engine of sufficient power to drive the dynamo, the initial cost of installation will, of course, be much greater and may be placed approximately at \$300.

Comfort Going to Waste.

The many small waterfalls throughout California might also be used advantageously in the production of electric power, the cost practically ending with the installation of the plant. The writer spent his vacation last summer at a mountain ranch in a beautiful canyon, where 75 miners' inches of water are tumbling down 100 feet, yet the owner had lived there twenty years without making the slightest effort to take advantage of the light, heat and power so prodigally provided by nature.

Light and Heat from Another Source.

To the farmer who is so fortunate as not to require an engine for irrigation or other purposes, and who feels that the purchase of one for electric lighting plant is not justified, the many excellent gas machines and oil burners now on the market should appeal. A machine capable of lighting a house of eight rooms and furnishing gas for cooking may be installed for from \$50 to \$250. The manufacturers claim to be able to produce a gas possessing a fuel value of 1500 to 1700 Btu units per cubic foot, while natural gas is only credited with 1000 Btu units per cubic foot and coal at 525.

The lighting fixtures for an eight-room house will cost in the neighborhood of \$30, while the stove or range may be had from \$5 up. The cost of operation depends, of course, on the service required, but as an illustration we give the following:

Cost for lights for an eight-room house about \$2.00 to \$2.25 per month.

Cost of running stove or range 10 hours and two oven burners 10 hours a day for one month, \$3.60.

This estimate is based on the maximum amount of service likely to be required and in many instances can be greatly reduced.

An Oil Burner.

We now come to the last, but by no means the least worthy, of the devices available for use in country homes—the oil burner. These machines are simple and the first a mere trifle. Nearly all can be adapted to the ordinary coal and wood stove with but little difficulty, and produce a strong, steady flame of intense heat. They are not, of course, suitable for lighting purposes, but for use cooking are excellent.

Give Wife and Daughters Modern Conveniences.

We have not attempted in this brief article to specify all the uses to which gas and electricity may be put in the farm home, but our desire is simply to awaken the universal prosperous farmers of California to the availability of many things which would tend to ease the often hard and uninviting lot of the farmer's wife. Every up-to-date farm possesses modern tools, yet many times that farmer's wife is expected to accomplish the arduous labors of a badly-arranged farm house with none but the most obsolete appliances. This should not be.

Be a Missourian.

The intending purchaser of lighting or heating plant should thoroughly investigate for himself the necessary apparatus and cost of operation. All the reliable manufacturers and agents are courteous and willing to show their machines in actual use. This will enable the buyer to choose intelligently the plant best adapted to his particular needs. Pocket book.—DUNCAN L. SMITH

Snake Bite Remedies

It is not often that fatality occurs from snake bites in California, but there are occasional sad cases. Intelligently and quickly attended the bite of a rattler is not dangerous in the least. But if the victim is left down and nothing is done to prevent the poison's absorption it will probably soon terminate fatally.

If the bite is on the extremities, the handkerchief and twist tightly above the wound to prevent circulation of poison. Make incision with knife at point of wound and draw poison out. No danger in doing this. Keep patient moving, especially if drowsy.

From many exchanges we clip the following which doubtless all have seen. The first is from a Florida paper:

Permanganate of Potash.

It might be supposed, the matter of fighting the effects of snakebite has been studied very closely in India and a number of remedies have been proposed. Among them is the use of an animal, injected into the flesh of the victim. One of the latest ideas is to make an incision in the flesh where the bite has been inflicted and introduce a few crystals of permanganate of potash, a well-known antiseptic drug, which is invasive. The more prompt the treatment, of course, the more hopeful the outlook. For this reason, hunters who foresee danger would do well to carry a little permanganate of potash with them and also have a pointed knife blade, which can be employed as a lancet on short notice.

In another paper we note: Dr. Jones' cure is most simple, and he prescribes it to be absolutely effective. Nothing more than tincture of iodine injected into the veins near the wound.

"This is an absolute cure," said Dr. Jones. "I have never known it to fail. I have used it constantly, and have never lost a case, even of the most serious sort."

In many camping trips a hypodermic syringe is not part of the kit, but it should be if there is any danger of being bitten by reptiles of any sort. But even without 'hypo' the use of iodine is simple. If the bite is abraded a short distance from the bite, scratched, say, with a quill or any sharp instrument so that the blood comes, and iodine is rubbed on freely, so it will get into the circulation, no trouble will be experienced from the bite.

A rattlesnake once bit a fine fellow on the nose. I stuck the small end of a knife in the flesh above the wound, injected iodine, using a quill as a syringe, and the fellow never felt the slightest ill effect, although the bite was a severe one.

The same rule applies to the bite of tarantulas, scorpions and other kind. Iodine is a sovereign remedy for them, and every man who spends a day in the country where these abound should carry a bottle of it with him. It may make him a savior."

History was going the rounds not since that a cowboy in Montana recently cured rattlesnake bites by rubbing alum, a lump about the size of a thumb.

Soda.
An old prospector in Shasta county

says he has no more fear of a rattlesnake bite than a bee sting. All he uses is common baking soda. Quickly cross-cut the wound and apply the soda dry, or if water is handy, it may be dissolved first. Keep applying it until it quits fizzing.

Kerosene.

"The following remedy is said to be a splendid antidote for the rattler's bite, provided it is used immediately after bitten. Take a pan or bowl and pour in enough kerosene oil to cover the wound. It will draw the poison immediately and in the course of a few minutes turn perfectly green; then pour out the oil and refill the bowl, being careful to put in enough oil to completely cover the wound. Leave the foot or hand in the oil as long as the oil turns green. Then put on a poultice of plain table salt and saturate thoroughly with oil. Keep this up about an hour and there is scarcely any danger of fatal results."

Ammonia.

Cross cut wound, suck poison, then cauterize with strong ammonia, administer internally as promptly as possible aromatic spirits of ammonia from a half to a teaspoon.

Which of the above is best we don't know, but amongst them may be one which you can quickly administer. That which is quickest at hand use.

Above all don't kill the victim with whisky or strong spirits. We once saw the statement of the death of a little girl from a snake bite, so supposed, which a physician asserted the real cause to be alcoholic poisoning from doting the child without "rhyme or reason" with whisky in the effort to save it from the other poison.

PORCH COMFORT.

With rugs, hammocks, swinging settles, cushions, chairs and tables all especially designed for the furnishing of the big front or side porch, all varied and tasteful in design and reasonable as to price, it would seem that the pleasant and healthful fashion of spending much of one's summer leisure in these airy lounging rooms must soon become a fixed American habit.

Porch blinds are another comfort, affording a screen through which plenty of light and air may reach the lounge. Drop leaf tables which may be folded against the wall when not in use are a convenience for the small porch, and a rack for fans and books will earn a welcome at once if screwed to the side of the house near hammock or easy chair.

TO AVOID BALDNESS.

A good wash for the hair, if you are becoming bald, is made of: Glycerine, one ounce; quinine, 20 grains; tincture of cantharides, one dram; spirits of nutmeg, two ounces; fluid extract of jaborandi, one-half dram; rosewater, one pint. Mix well and apply twice a week, using a small, stiff brush.

To clean paint that is not varnished take a flannel and squeeze nearly dry out of warm water and dip in a little whiting. Apply to the paint, and with a little rubbing it will instantly remove grease, smoke or other soil. Wash with warm water and rub dry with a soft cloth. It will not injure the most delicate color, makes it look like new and lasts much longer than if cleaned with soap and water.

COW TALK

SUGAR BEET PULP
KOW-BREAKFAST-FOOD FOR COWS

QUESTION—What is a cow?

ANSWER—As I said before, a cow is a square critter with a peg at each corner to stand on. I am built square so that I can hold lots of food.

The Cow Talks: I have also been called a "milk machine." To a nail machine they feed wire and get nails. So they expect to feed me wire-y, dusty, musty hay and get milk. Nothing in it. Don't expect to get wire nails from a nail machine without feeding it wire, nor milk from this milk machine when fed on wire-y hay, mostly trodden under my feet. I'll tell you what to feed me—fill me up on Kow-Breakfast-Food when I come in from the pasture.

Kow Mathematics: Then I'll give you 32 cents' worth of milk for a cent's worth of pulp. Besides, I figure I'll get fat at the rate of about one pound a day.

P. S.—You can get fresh Kow-Breakfast-Food at 50 cents per ton from the chute at **Los Alamitos Sugar Factory, Los Alamitos, Cal.**

Queries and Replie

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Fistula.

I have a mare which has a small fistula on withers. It heals over then breaks and discharges.—G. H. H. Tulare.

You had better take this mare to a veterinary and have him explore and open the sinues up to the bottom and treat with a rychloriac solution and slough out diseased tissue.—W. J. Oliver, V. S.

If service of a vetinarlan cannot be had the following from Diseases of the Horse may be of service:

In the earliest stage, when there is soreness, enlarged lymphatics, but no well-marked swelling, the trouble may frequently be aborted. To do this requires both general and local treatment. A phisic should be given, and the horse receive one ounce of powdered saltpeter three times a day in his water or feed. If the fever runs high, 20-drop doses of tincture of aconite root every two hours may be administered. The local application of cold water to the inflamed spot for an hour at a time three or four times a day has often proved very beneficial, and has afforded great relief to the patient.

Cooling lotions, muriate of ammonia or saltpeter and water; sedative washes, such as tincture of opium and aconite, chloroform liniment, or camphorated oil, are also to be frequently applied. Should this treatment fail to check the progress of the trouble, the formation of pus should be hastened as rapidly as possible. Hot fomentations and poultices are to be constantly used, and as soon as the presence of pus can be detected, the abscess wall is to be opened at its lowest point. In this procedure lies our hope of a speedy cure. As with any simple abscess, if drainage can be so provided that the pus will run off as fast as formed without remaining within the interstices of the tissues, the healing which follows will be rapid and satisfactory.

Bitten by Snake.

I have a young cow, which was in apparently healthy condition until yesterday. When I went out to milk I found that the left side of her face was all swollen and slightly back and below her ear seemed to be hard lumps. We bathed it with a liniment which we have, also with a mixture of turpentine, lard and nutmeg, rubbing it in well. She does not seem to be able to drink much water although she can eat hay. This morning the swelling is slightly gone from the side of her face, but there is a hard lump in her throat. As there is no veterinary around here you will greatly oblige by information as to what this is and giving a remedy.—R. A. S., Elsinore.

Your cow has been bitten by a tarantula or poisonous reptile. A liniment made of equal parts of raw linseed oil, sprits of turpentine and aqua ammonia, shake and rub in daily until swelling and soreness ceases.—W. J. Oliver, V. S.

Best Vetch.

Will you kindly inform me which is the best kind of vetch to be used for a cover crop, and where the seed can be obtained?—Alex Craig, Folsom.

What is known as winter vetch is the best. Seedmen in all parts of California have it on sale.—J. W. M.

Mr. Mills will have an article on green manuring next week.

Possibly Tuberculosis.

What ails my Jersey cow? She always eaten hearty and appeared well but last fall a hard lump came on side of her jaw about the size of a goose egg. I cured it by rubbing ammonia and turpentine and it never returned. She came fresh December and about half the year since the right front quarter of udder has been bad; it will be right one milking, next milking it will be caked very hard and but a little milk; then for a few milks will be lumps and strings and a little milk for several days. She breathes hard, makes quite a noise but think it is caused by food in her throat.

She is an exceptionally heavy ter cow, and would dislike very to lose her.—Country Greenhorn.

This cow should first of all be tested for tuberculosis. The lumps constant condition of bad blood would make me doubtful of her. The best milkers that often look thin eat well, will react and when they will show a generalized condition of the disease that is appalling.—M. J.

Filling a Silo.

I want to impose upon you by asking you concerning the details of filling alfalfa into the silo. I have a silo constructed and the cutter re but never having filled a silo with alfalfa I have felt that out of your perience you might offer some suggestions concerning the handling between the field and the cutter would save us trouble. I would much appreciate any suggestions will be kind enough to give.—G. DON H. TRUE, Reno, Nev.

Should ensilage be tamped in filling? Does it require a weight on the silo is filled? How much alfalfa a fifty-ton silo? What is a satisfactory cutter and the power required?—J. S. STEWART, Balls Ferry.

Both the above questions will be answered in Mrs. Sherman's department next week in an excellent article on filling the silo.

Bees in the House.

I wish some bee man would in me through your valuable weekly, to get a swarm of bees out of my house; they got in the cracks and an outside chimney.—E. B., Riverdale.

If anyone wants a swarm of bees here is doubtless a chance. And it is the only one, for a school house in Los Angeles is infested the same. Plugging up cracks and doling tar were both tried, but if they ever knew it they didn't show it. The building is said to do a turn. If the bees are not perhaps the owner will take home if notified.

Vineyard Run Down.

I have a vineyard on this place is past its prime, can you inform by mail if there is anything I can do to prolong life?—T. J. B.

This was referred to Mr. Mills who writes that unless he knows the particulars he cannot give much information. In general it may be that best of care, add humus to the soil by fertilizing with coarse manure, spraying with Bordeaux mixture among the steps necessary.

Warts on Cow's Neck.

Some unsightly warts have appeared on the neck and throat of my yearling Jersey heifer. They do not hurt her at all except as to looks but looks is the entire bakery. I want to take her to the coming county fair.

If the warts have a constricted

them off with sharp scissors and the parts with nitric acid or, the acid applied every second day burn them out. You must be careful in the use of it, about three applications is usually enough.—W. LIVER, V. S.

Col Worms.

I have two colts, 3 months old, that their tails. I have greased them for three times, but don't seem to get them relief long. I feed them, their mothers, rolled barley, oats and barley and alfalfa hay; you advise me of something that will cure.—R. B. E., Tenderfoot Co., Compton.

My colts are troubled with rectal worms. Inject with the following: raw linseed oil about ten drops; spirits of turpentine two drops. Take piece of garden hose, cut in rectum about 15 to 18 inches, and can be done easily if you smear with grease. Elevate the end of the hose should be about two feet out of the rectum. Insert funnel and pour the mixture and let it gravitate into the bowels. Remove the hose slowly. Make colt retain mixture for some 15 minutes. You may be obliged to repeat in a week. Rub a little lard on the rectum occasionally.—W. J. V. S.

In answer to C. H. L. Use the treatment as prescribed above. In addition wash the tail clean with the following lotion: Eucalyptus 2 oz. to quart of water. Repeat if necessary. W. J. O.

Worms.

If you please inform me through the Cultivator as to whether currants will in this part of California? If at what time of year must the slips be cut out and where can we get them? at the large kind.—Mrs. J. D. Winter, Del Rosa.

Plants have never succeeded in

Southern California, and we do not think you will find profit in planting. An experimental plot may be tried, but would advise nothing extensive.

Skimming Too Deep.

Will you kindly tell me, through your columns, wherein my trouble lies.

My cow is a young one, fresh, I believe, a year ago, and her butter is filled with tiny white flakes, which I take to be particles of sour milk.

These flakes cause the butter to taste sour; often it is three day's old.—S. H. P.

The flakes of sour milk are caused by skimming too deeply into the milk when taking off the cream. The simplest remedy is to add a pint to a quart of water to each pan of milk when it is set and then it will skim much easier; avoid skimming too deeply into the milk.—M. E. S.

Measuring Water.

Are water companies obliged to give water under a four-inch pressure if demanded. Old Subscriber.

The amount of water in California is usually measured on the four-inch pressure basis. If the water is deeded with the land and on that basis then you can surely demand your full head under four-inch pressure. Also if a company has contracted to supply you a certain number of miners' inches the law would presume the general custom would prevail and it should be measured to you under four-inch pressure.

Keep Down the Dust.

The following is a fine hint just received from Buena Park:

I would like to tell my friends of the Cultivator who live on the dusty side of the road to haul a few loads of weeds, spoiled hay, corn stalks, or even straw manure onto their road and note the difference in the quantity of dust which the good wife has

to sweep out each day. One day's work will do it, and it will last a long time. This in interest of better roads.—J. L. Tummond, Buena Park.

Legal Queries

Damage by Cow.

A neighbor's cow staked out in the road broke loose and spent the night in my garden practically destroying the whole thing. The garden I valued at \$100. The owner of the cow refuses to compensate me for the loss and claims the cow was firmly staked and he had a right to pasture in the road. Can I recover for the loss of my garden?—G. B. F.

Yes, unless there was negligence on your part.

Damage to Horse.

I hired my horse to a neighbor to cultivate his ground. While the horse was in the possession of my neighbor he became snared in a wire fence and is badly injured so that I shall lose the use of the horse for some time, and possibly for good. Can I recover for the horse damage while in the possession of my neighbor?—R. P. S.

Yes.

Peddler's License.

Will you tell me if a man has to secure a license to peddle farm products raised by himself in a township where there is no license prescribed. In other words, is a county license necessary for a party to peddle products grown by himself?—S. M.

No.

BETTER THAN EVER.

Amongst the many manufacturing companies of San Francisco to suffer an entire loss in the great fire of 1906 was the Krogh Manufacturing Company, who make the well-known Krogh pumps. This concern is one of the oldest and best known manufacturers on the Coast and their pump has won most hearty approval by irrigators and others who have had occasion to use an economical water lifter.

For years this well-known firm was located on lower Market street, and after the fire were compelled to seek quarters in the outskirts of the city and begin with an entirely new plant. The magnitude of this cannot be at first appreciated by one not in touch with the business, for it was not simply a case of placing orders for new machinery, but new designs must be drafted, patterns made, and every step of the work from start to finish laboriously worked out. Of course, in doing this they have been enabled to build larger and better, and to profit by the experience of past years. After a year and a half of this constant struggle the firm is again located in the heart of the manufacturing district with a new plant most complete in all its appointments. This plant has a far greater capacity than the old one, and the building is especially designed and equipped for their practical needs.

In celebration of this event the firm has now ready for mailing a new 64-page catalogue, No. 50, showing complete line of centrifugal pumps and other pumping machinery. This catalogue is very complete and has much of interest for those desiring to purchase goods of this character, but while it is an expensively gotten up it will be mailed free to Cultivator readers who contemplate establishing any pumping machinery. The address of the firm is Krogh Manufacturing Company, 127-133 Beale St., San Francisco, California.

A PUBLIC SALE OF SHORTHORNS.

The auction sale of Judge Carroll Cook's shorthorn cattle and Berkshire swine at the California State Fair on September 14 will be a great event. Forty high-class bulls, cows, heifers and calves and twenty head or registered Berks. will be sold at auction.

It's a grand bunch of stock in which there has been no culling and many prize-winners are included.

Stock will be on exhibition at the grounds after Sept. 9.

Write Fred H. Chase Co., 478 Valencia St., San Francisco for catalogue.

VACATION TIME.

Oh, glorious
Long
Vacation days,
Your coming
Hits us
Forty ways,
If we are
Only
Little men
Along about
The age
Of ten.
Our books,
Dog eared,
We cast aside,
Slates, pencils
And
Erasers hide,
And try,
As far
As that's concerned,
To unlearn
Everything
We've learned.
If we
Are somewhat
Older—well,
We see
A chance
To loaf
A spell,

folks on the first page of this issue. If the woman is mentally constituted so as to rest at home, and not to keep everlastingly at it, she will be more rested by quietly staying there and reading a few good books, renewing her youth and generally brushing up the mental department which will be a change of labor and give rest.

Hire a Girl a Month.

In some homes where help is not employed regularly, the vacation money may find wise expenditure in hiring a girl for a week or a month. If heavy work is to be done, a good stout working girl or a Jap or China boy may be secured. If the work be light a girl of different class—possibly some college girl, independent enough to take such work; also willing to add a little to her coming year's pin money, will bring new life and companionship into the home. Such a step will, in some cases, give

who pitches the tent then sits down or goes hunting while his wife continues to get all the meals and the camp work under conditions twice as hard as in the home, is worthy a vacation. For the man enter into the spirit of the work, chop the wood, build the fire, fry flapjacks, do all the rest of the cooking—that's the fun of the trip, that is if the rest of the family can stand his cooking.

If the men just sit around waiting for the dinner bell, fire the bunch.

Getting Home Again.

Above all, as Mr. Isaac says, greatest pleasure is getting home again." The old home is more appreciated. Don't let that appreciation wear off. Love it more. Bear it up to the limit of your financial ability; still more beautify and adorn with Love and Contentment, cannot have unlimited means of adornment. But all may have unlimited Love. Without that is no home.

To sit around
And read
A book
And keep
Our standing
With the cook.
But, whether
We
Are young or old
We prize
It as
A miser gold.
Vacation—
Fellows,
That's the stuff!
—[San Bernardino Sun.]

THE WIFE'S VACATION.

Man works from sun to sun
Woman's work is never done.

IN other words woman's work is being done all the time. The first up in the morning—sometimes. Always the last to tidy up the house and have it shipshape at night.

To be sure these days of separator, creamery, gas, electric lights and other modern luxuries—necessities they have almost become—the woman's tasks on the ranch are different than they were years ago. Besides, the satisfactory returns to fruit grower and farmer for the past few years have placed many conveniences and labor-savers in the home which make household labor much lighter.

But at best it's still hard and now and then the good wife should—must—take her rest. It may be at home as we have suggested to the men

more rest to the homemaker than a hard and tiring jaunt to ocean or mountain.

But people are different.

Tired of Home.

Maybe you are tired of the four walls. The great outside world is better than your home. Everyone else has things better. Other wives have easier times. The eternal grind is dreaded from morning till night and things look blue generally.

It's time to go to the beach. Strike the gentle landlady with the little back room at \$5 to \$20 per week, "in advance, please," and deal with the class which has to make a year's living in a few months and you will have such a "good" time that you will be happier in your little possessions when you get home.

But, of course, there are other quiet places where real rest and recuperation are to be had. For a rest go to the mountains. For a "big" time go to the beach and dance and bathe and every thing else which tires.

If the mountains are not too far away, a big spring wagon with camp appliances loaded, a week's outing can be taken cheaply and restfully.

Don't Let the Men Be Boarders.

Above all, if the whole family goes to the mountain, make the men folks fry the bacon, peel the potatoes and do the entire camp work. The man

Continue the Vacation.

During the coming year regular household affairs so that leisure had for a short story or some reading every day. If the vacation or outdoor living room (be sure have that) isn't shady and cozy make it so with vines or canvas or screens. Plant sweetpeas and other flowers that the table may be graced day of the year.

Be serene and have that contentment which will make your prayer a benediction to the whole family.

HOUSE AND HOME.

A house is built of bricks and mortar of sills and posts and plaster. But a home is built of loving hearts that stand a thousand years. A house, though but an humble dwelling within its walls may hold a home of priceless beauty, rich with Love's eternal gold.

The men of earth build houses—dormers and chambers, roofs and domes—But the women of the earth—oh, knows!—the women build homes. Eve could not stray from Paradise for, oh, no matter where Her gracious presence lit the way; Paradise was there.

Nixon Waterman

To prevent the juice of fruit from soaking into the bottom wash the crust over with a beaten egg before putting in the fruit.

The Personal Neatness Club

ANOTHER little bunch of suggestions comes to our club this week. The first in answer to a former one. We still hold our old name as the want of a better. We are all open to suggestions.

Here's our first hint:

Hint for Porcelain.
I wish to suggest to Mrs. C., who has asked for a hint on removing the grime of bath and other porcelain tubs. As she says lye may be effective, but not agreeable to use. I have a coaloil bottle in the corner of the tub and on it an old cloth. After opening in cork—like pepper bottle—gives me an appliance which works like a charm. With a squirt of the oil about the tub, with cloth and light rubbing finishes to the queen's taste and leaves it smooth and clean. Gasoline is good, but I like kerosene best. Any of the powdered soaps also do well. Another hint:—When the sink, tub or bathtub get yellow and won't whiten with the above, moisten all over, then rub with chloride of lime. Let it stand an hour or two, or over night, then wipe off when the whiteness and gloss will be most pleasing.—E. R., Glendale.

Gloves and Darning Hose.
Here is a hint to the girl who wishes to keep her gloves white. Take one spoonful of sugar to a quart of warm water, make a lather with soap and wash the gloves in this. Then rub the soap on the gloves

as this has a tendency to make them yellow. By stretching them while wet I have found they keep their shape better.

Also a darning hint which I have found of value. When your lace hose begin to show signs of wear, as they often do, by dropping a stitch, instead of making an ugly darn, by using darning cotton slip them under the machine and stitch back and forth. This makes a very neat darn and also prevents the hose from raveling further.—Miss S., Los Angeles.

That last hint should save enough pin money in fancy hose expense to make up a year's subscription to the Cultivator.

Here are some more hints from an old friend.

Caring for the Toilet Articles.

Brushes for toilet use wear longer and do better service while they last if they are well taken care of, and all brushes should be placed in such a position that all water will drain from them. Silver back brushes and other articles of silver can be kept shining by rubbing them with whiting and then polishing with chamols leather, and glass toilet bottles can be made to glisten by rubbing them with alcohol and whiting, allowing it to dry on the glass and then polishing with a soft cloth.

The best way to clean plaster of Paris ornaments is to cover them with a thick layer of starch, then let it dry thoroughly and brush off.—Aline.

Recipes for Camping Days

It is doubtless the men and women of the company who take the greatest pleasure in a camping party, often the work of the women to make the well filled hamper which is taken along. Of course experienced campers will scorn anything but even smacks of advice, but those who have not gone may welcome a suggestion or two.

At the first place, the food which is taken along must carry well and keep well. For this reason prepared in glass jars are not to be recommended, except in small quantities since there is great danger of leakage. Cucumber and other pickles will be found more desirable than chow chow and liquid

It is a good idea to put in a supply of sweet chocolate, raisins and nuts. They take well and serve for sweet meats. Baked beans can be packed in an earthenware vessel and are always appreciated on a camping trip, as also is boiled ham. To improve the flavor of the ham after it is boiled, sprinkle it with bread crumbs and a little sugar and bake it for about twenty minutes. If the ham is quite salty, it should be soaked for twenty-four hours before cooking and care should be taken that it is cooked long enough. It should simmer gently for five or six hours and will be improved by the addition of a few spoonfuls of molasses.

Potted Meats.

A camping party will be sure to find a jar of potted meat a great delicacy. With a quart of potted chicken, a cup of minced ham is an improvement. Veal and tongue, and veal and ham are delicious when put together. A cold roast and corn beef makes a savory dish of meat to have on hand, and a veal or beef loaf will be easy to carry and easy to serve.

Take a Fruit Cake.

For cake put into the food hamper a large dark fruit cake. This can be kept as long as desired, and to add variety, a loaf or two of some lighter, more perishable cake may be added for use during the first day or two. Cup cakes will keep several days if baked in muffin tins and completely covered with frosting.

It is, of course, impossible to take a food supply for a great length of time but where the camping trip will last only a few days these suggestions will be applicable.

From a Riverside subscriber we have some hot weather recipes. Tried and found satisfactory. They are also economical.

Frozen Eggnog.

The Produce Markets San Francisco

Los Angeles Markets

LOS ANGELES, Aug. 28, 1907.

Butter.

With the excessive holdings of Eastern butter in storage, the butter market is guessing. The arrivals continue greater each day which has a tendency to weaken the market. Some even maintain that lower quotations will prevail soon. Quotations still stand exactly as last week.

Creamery extra per roll.....65
Creamery first.....60
Dairy.....55
Cooking.....47 1/2

Cheese.

The Suisun Republican says: What was undoubtedly the most valuable carload of dried fruit ever shipped out of California was one containing dried apricots which was shipped this week by the Ernst Luehning Company to Hamburg. The fruit in this car was worth more than twelve thousand dollars at this point and was entirely of this year's crop, being the initial shipment from this district.

THE IRRIGATION CONGRESS.

Sacramento, with the aid of several
of the Northern counties, is making
a strong effort for the success of the
Irrigation Congress which meets in
that city on Sept. 2-7. A new build-
ing has been erected on the capitol
grounds adjoining the agricultural
pavilion in which the meetings will
be held; the streets are being hand-
somerly decorated and one of the finest
electrical parades ever seen in North-
ern California will be given. All
sorts of entertainments are being
planned for the visiting irrigationists
and nothing which hospitality can
achieve will be left undone by the
capitol city. As showing how wide-
spread is the interest being taken in
irrigation, it may be noticed that del-
egates have been announced as com-
ing from even the remote Eastern
States, where irrigation is practically
unknown, while all the arid and semi-
arid States will be represented.
The rapid absorption of the public
domain, the wonderful increase in
population of the United States, the
natural desire of people for homes,
and the immense fertility of the so-
called arid lands when under water,
have given an unexpected impetus to
irrigation in the past few years, until
it is now one of the leading questions
of the day. The coming congress
will be the largest and most impor-
tant ever held, and out of it will un-
doubtedly arise much valuable legis-
lation of importance to the great
West, especially as among the repre-
sentatives will be many of the lead-
ing statesmen of the country.

BIRDSSELL HULLERS.

Over fifty years ago the late John
Comly Birdsell invented the clover
huller, thresher and cleaner. Clover
was not then cultivated very exten-
sively and the seed saved amounted
to but a few hundred bushels, and it
is said that his first machine could
have hulled the entire clover crop of
the United States at that time. To-
day the proceeds from the sale of
clover seed reaches into the millions.
This great advancement was brought
through incessant toil on the part of
Mr. Birdsell, who began early to cir-
culate and spread broadcast pham-
phlets treating on the value of clover;
through this method he gradually cre-
ated a market for his machines.
In the early days of alfalfa in this
country, he also realized its great
value and placed the first and only
alfalfa huller on the market; this ma-
chine is built for the hulling of alfalfa
seed exclusively.

These two hullers are standard and
are now known throughout the world
wherever clover and alfalfa are grown,
and it is generally conceded that the
name "Birdsell" alone stands for qual-
ity, durability and excellency. Thou-
sands of Birdsell clover and alfalfa
hullers are now in use and are every-
where recognized as the best. A fine
catalogue is issued by the company
which is well worth sending for.
It may be secured by writing the
Birdsell Mfg. Co., South Bend, In-
diana.

BANK BY MAIL.

Mail order business is being sought
by the bankers these days and suc-
cessfully. The farmer and small-town
business man is finding that a deposit
in the large business centers is not only
a convenience, but almost a necessity.
The transaction is so simple that the
mail proves practically as satisfactory
as personal presence at the window.

But the country depositor asks, "Is it
safe?" Nothing can be safer. Choose
a safe, well-managed institution of
large capital and open an account.
But first, if a little further light is
wished, write the California Safe De-
posit and Trust Co., for a little book-
let "Banking by Mail," which will be
mailed free if the Cultivator is men-
tioned.

That institution, by the way, is one
of the big, strong institutions of the
State. It has over twelve millions of
assets, and pays four per cent on
deposits.

DONLON BROS. SAY:

OXNARD, CAL., MAR. 29, 1907.
Cultivator Publishing Co., 115½ N. Broadway, Los Angeles, Cal.

Gentlemen:—
Replying to yours of the 27th regarding the milking machines installed in our dairy, beg to advise that the name of the machine is the Burrell-Lawrence-Kennedy Cow Milker and it is manufactured at Little Falls, N. Y.
You ask us if we are pleased with the Machines. If our machines were destroyed tomorrow by fire or otherwise, we would immediately install a new outfit. We believe this to be as strong a recommendation for the machine as it is possible to give. We further believe that the cow-milking question is now practically solved and that it will be only a matter of time when all large dairies will use machines instead of the old hand process.

The Burrell-Lawrence-Kennedy machine is very simple. Any man, with half a head, can operate this machine, even though he has never milked a cow. Each machine milks two cows at the same time, and one man, after a very little practice, can easily operate two machines. Our old cows took kindly to them from the start; the heifers kicked quite a bit, but now stand like old cows. The connections with the cow do not in any way hurt her teats, and there is absolutely no danger of the machine drawing blood as some machines do. Another great point of this machine is that we can get clean milk—something that nobody can do by the hand process.

Baker & Hamilton are the sole agents for this machine on the Coast, and any information that you desire about the machine itself can be had from them. We shall be glad to furnish you with any additional information regarding the working of the machine.

About the clean milking of the machine, we find that they strip the cow as clean, if not cleaner, than by the hand process. We get about the same amount of milk now as we did before we started using the machines a month ago, and the amount is increasing. Trusting this is satisfactory,
Yours very truly,
DONLON BROS.

R. H. FLINT CONVINCED.

SAN MUSTO DAIRY, HOLLISTER, CAL., Aug. 8, 1907.
Baker & Hamilton, San Francisco, Cal.

Gentlemen:—
The Burrell-Lawrence-Kennedy cow-milking machines are satisfactory in every way. I have been using them about four months and am convinced that the cows give more milk when milked by machine than when milked by hand by the average milker.

The machines are easily cleaned and kept in order. Heifers are broken to the machines in a few minutes. I expect to install more machines next season.

San Juan Bantista, Cal., R. F. H.

Yours truly,
R. H. FLINT.

WIEGMAN & POORMAN RECOMMEND THEM.

ALVARADO, Aug. 3, 1907.

Messrs. Baker & Hamilton, San Francisco.

Gentlemen:—
Your favor of the 31st ult. is at hand. You ask what results we have had with the Burrell-Lawrence-Kennedy Milking Machines, and whether they have given satisfaction.

We commenced using the machines last November. Owing to the fact that occasionally meet some one who asserts that cows on which the machines been used during an entire lactation period would have a diminished flow of after freshening again (although these assertions are mere rumors, in no case, from a person having experience or knowledge of such effect,) we had not tended to express our views until we had used the machines a full year. That have little fear of bad results was shown when, after using five machines months, we ordered five more, all of which are now in operation.

Almost all of the cows milk as well, and many of them better, with the machine than with hand milking. When first using the machines the cows more or less nervous and do not let their milk all down, necessitating hand stripping. With patience and gentle treatment this is soon overcome, and a majority of cows will be stripped out cleaner than by the average hand milker.

The machines are a decided advantage in the breaking of heifers. With the results have been satisfactory in every case.

The men take kindly to the machines and most of them soon become experts in their use. Where two men with machines do the same work as three with hand milking, the latter become jealous because of the easier work of the others. Think the proper allowance of work in the use of the machines would be five at 150 cows—for three men.

While the reduction of the number of help required is a partial offset to the cost of the plant, we consider the chief advantage in the use of the milking machine that of having the milk free from dirt, which is not possible, however great the care, in hand milking. In view of the exactions of health boards, which in many localities could not be complied with, the machines seem to us a necessity when furnishing milk for use in cities.

Yours very truly,

WIEGMAN & POORMAN.

C. MARTINELLI SATISFIED.

LAKEVILLE, Feb. 6th, 1907.

BAKER & HAMILTON.

Dear Sirs:—
A few lines to let you know that the milking machines are in running order, and are satisfactory.

Yours very truly,
C. MARTINELLI.

Irrigation Canal Through Butte County

THE irrigation system of the Butte County Canal Company is located in the Sacramento Valley, California. This valley includes all that area, largely of alluvial soil, lying between the city of Sacramento on the south, Redding on the north, and between the mountains of the Coast Range on the west, and the Nevada Mountains on the east. It includes about 3,000,000 acres of arable and comparatively level land. It is the last important section of California to be thrown open to the home-owning farmer, and is remarkably rich in natural advantages. The marvellous and enduring fertility of the soil has largely been the factor which has retarded its best development, as holders of large tracts of land have found it profitable to cultivate grain until diminishing returns and depreciation in quality compelled a change to irrigation and diversified farming. Prof. Elwood Mead, of the U. S. Department of Agriculture, an authority on the subject, states: "Southern California has demontsarted the value of irrigation. Northern California illustrates its latent possibilities. When one considers the vast area of the Sacramento and San Joaquin Valleys, with a shape by nature for the easy spreading of water; with a soil of great fertility, and a marvelous climate, there is no doubt that it is to be, during the twentieth century, a great field of opportunity, not of the farmer alone, but of the engineer, the lawyer, and the student of social and economic questions. The available

water supply of this valley (Sacramento) ought to make it the Egypt of the Western Hemisphere."

The Butte County Canal takes its water from the Feather River, which has its origin in the high Sierras. The height and extent of the water-shed of this river (3,350 square miles), and the volume and regularity of its flow, constitute the ideal irrigation supply.

Careful records of the flow of Feather River at the point of diversion into the Butte County Canal give a minimum flow of 1,300 cubic feet of water per second, or 65,000 miners' inches. This supply of water will here effectively irrigate 200,000 acres of land in diversified crops, and as the system is not designed to irrigate more than 150,000 acres, the sufficiency of water is assured.

The structures of the Butte County Canal consist of a concrete headgate of staunch construction, calculated to resist the highest pressure during flood season; an auxiliary headgate of timber and concrete, and many smaller weirs, gates and trunouts, principally of timber, but which are being replaced as occasion arises, with concrete, or partly concrete, construction. The main canal is about thirty miles in length, and the lateral ditch system, which is being rapidly extended, aggregates, at the present time, about thirty miles in addition. The entire system represents an investment of over \$475,000.

Coulson's Improved Mash Egg Food

**Takes
Less
Feed**

**Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Have stood the test fourteen years.

2 to 60 Horse Power

Here's a Good Word from a Man Who Knows

Los Angeles, Cal., July 8, 1907

To Whom it May Concern:

We have recently installed and now have in operation on our ranch near Anaheim a 60-horse-power Columbus Distillate Engine. This engine is belted up to a No. 6-2 stage pump, in a 90-foot pit, and is running along on an apparently easy load and pumping by actual measurement 150 inches of water. Our fuel consumption has averaged so far four gallons per hour.

To the man who wants plenty of water, little trouble and economical engine, and one that develops the full horse power, we can cheerfully commend the Columbus Engine.

We have had experience with high speed so-called big horse power engines, and know whereof we speak when we recommend the Columbus Engine to the public, knowing that it is a kind you can depend upon free from all trappy devices, simple to operate and economical.

The writer has run a 10-horse Columbus Engine at Tropic, for the past four years, and can vouch personally for the above statement.

Trusting that this information will be a benefit to those interested, beg to remain,

Yours very truly,
THE ANAHEIM PRODUCE CO.,

The Great Valley of California

*The National Irrigation Congress Being Held This Week
in the Midst of the Greatest Irrigation Possibilities
of Any Section of Like Scope on This Continent*

The Fifteenth National Irrigation Congress convening this week, is in the center of what is probably the greatest single irrigated area on the American Continent, and by the greatest irrigation project that the National Reclamation Service has considered its organization. This is the great Interior of California, the valley of the Sacramento and San Joaquin. It is five hundred miles in length and comprises approximately ten million acres—an area so vast that even in their wildest enthusiasm—and the Reclamation Service officials are enthusiastic over it—they have had no more than a mere beginning, at least at present.

prosperity so largely depends. It means new and greater opportunities for those who seek lands and homes, and new avenues of trade and commerce. The importance of the addition of such an area devoted to the most extensive form of agriculture can hardly be overestimated, and yet the total combined area of all these projects is less than one-third that of California's Great Valley.

California's Valley extends in a northerly and southerly direction from the thirty fifth to the forty-first parallel of latitude. Were it possible to transfer it to the same latitudes on the Eastern Coast of the Continent, it would include the city of New York on the north and extend southward

converted into a land of little farms supporting a great population.

Plans for such a project have been partly worked out, but are still incomplete. For nearly ten years the United States Geological Survey, and later the National Reclamation Service, have been making surveys and investigations in this valley and the contiguous water-shed. Streams have been measured, a topographical survey of the valley floor begun, the underground waters studied. Mountain valleys suitable for storage reservoirs have been sought out and measured, for the summers are rainless in California and the winter flow must be held back by great dams. Fortunately nature has been liberal in providing natural storage

Orchard Scenes in Sutter County, Under the System of the Butte Canal Company

The National Reclamation Service is now building twenty-five projects that, when completed, will irrigate 3,198,000 acres. These projects will cost \$100,000,000, and will provide farms for 250,000 farmers. Measured by existing standards, twenty-five projects will maintain in command plenty a combined rural and urban population of 2,000,000, or one-fortieth of the entire population of the United States.

The building of these projects means the addition of a vast area to the cultivated lands and provision for a vast increase in the population of the United States. So great is this prospective that it is a matter of immense importance to the people of the whole United States, for it means a large increase in the agricultural production upon which the maintenance of our present

to Cape Hatteras on the Coast of North Carolina, and include within its boundaries the cities of New York, Brooklyn, Philadelphia, Baltimore, Washington, Richmond, Norfolk and Raleigh.

This great valley inclosed by steep and rugged, though forest covered mountains, presents a great opportunity for irrigation on a colossal scale. The water supply is ample, but little of it is used for irrigation because this has been the land of princely wheat farms for which California is famous, and the development of intensive farming systems has only lately begun. Within the past few years several irrigation canals have been constructed and now it is proposed by the engineers of the National Reclamation Service to construct a mammoth system of engineering works by which the whole of this splendid prairie may in time be

basins, and investigations, so far as they have proceeded, indicate that every available irrigable acre may be supplied with water. One reservoir site on the Pit River, the principal tributary of the Sacramento, has a possible capacity of 3,000,000 acre feet, enough to cover one foot deep every acre of the twenty-five great irrigation projects now being built by Uncle Sam.

The construction of the reservoirs necessary to increase the irrigation of the millions of acres of dry lands in this valley will, it is asserted, practically effect the reclamation of the million acres of swamp lands in Sacramento and San Joaquin rivers. The drainage problem is scarcely second to the irrigation problem in this basin, and it is complicated by the presence in the rivers of vast

Deciduous Fruit Cultu

MAKING RAISINS IN CALIFORNIA.

THE raisin industry of California compares well with orange growing in the volume of output of the product in the green state. The oranges foot up about 20,000 cars, which, of course, is in the green state. Raisins amount to about 5000 cars, which would amount close onto 20,000 if shipped green. The crop has amounted to as much as 103,000,000 pounds of the cured raisins.

The increase is not as rapid as might have been had not disease arisen from the lack of knowledge in handling lands that have become alkaline. Raisins were made in California as long as fifty years ago. Malaga and Faher Szagos were made into raisins at one time, but Muscat and Muscatell now make the bulk of the raisins cured in the State. From these are made seeded raisins which are without doubt the acme in the raisin line. Seedless Sultana and Thompson seedless make the seedless grape of the currant class, but they have a distinct flavor from the seeded Muscat. The true Zante currant is raised in a small way in certain parts of the State but the Thompson Seedless has supplanted it almost exclusively, being larger and in most places a better bearer.

Harvest begins in the northern raisin sections about the last of August and in Southern California about a month later. In the desert regions which have so far produced little more than samples, the harvest begins about the middle of July. There is little doubt that the desert will sometime produce the sweetest raisins grown.

There are certain sections where the finest Muscats are used in making London Layers. These are the perfect bunches that are placed on the drying trays as they are cut from the vines, being so arranged that they will produce the handsomest appearance when dried. They are not molested after being placed on the tray, except to turn them over. After the stems dry, they must be left in position and so packed in boxes for the market.

Each packer in the vineyard is provided with two trays, one being used for perfect bunches for London Layers and the other for imperfect bunches and scraps. The latter are run through a machine which knocks the stems off and are afterward boxed as stemmed raisins, or made into seeded raisins. Before improved machinery was introduced for this purpose, a limited quantity of seedless Muscats were produced from the small raisins which grade into the smallest size.

After the grapes have lain in the vineyard till the upper sides of the bunches have turned brown and are shriveled two men go down the rows placing an empty tray on top and turning both over, thus leaving the grapes turned onto the tray with the brown and partly dried side down. After the grapes are dried to a sort of rubber consistency, they are stacked to a convenient height. The test for this stage is when a jelly will come out of the stem end when rolled between the fingers. The stacking is done in the morning while the stems are tough so as to prevent breaking. The raisins may be left in the field a few days, care being taken not to allow them to become so dry that the jelly test cannot be made on the larger berries. They are hauled to the raisin house and placed in sweat boxes and stacked one above the other squarely and placed in a room that

can be closed tightly or ventilated will. These boxes are a little more than two by three feet and six inches deep. When layers are laid the bunches are laid without touching on heavy paper, one layer above other till the boxes are full. When the sweating process has been used for fifteen or twenty days, raisins are so cured that there is even degree of texture throughout the entire lot.

The sweat boxes are taken to packing tables and the bunches are trimmed and packed in boxes holding five pounds for London Layers. Blowers of Woodland invented a device which is used for packing, a metal tray the size of the inside of the packing box and has a movable frame. The bunches are placed on the tray with the most of the stems up. The frame is filled till the tray is five pounds pressed down and this is placed a sheet of paper on top of this is placed a steel plate that will fit into the regular packing box, the whole thing turned over and placed in the box, the steel sheet drawn out and the metal box removed. This makes a handsomely finished box packed.

When standard sizes are made, boxes holding twenty pounds are used. Loose grapes and the imperfect bunches are run through a stemmer and graded into four sizes. They are packed into boxes that are sent to the stores.

PECAN CULTURE.

The article on "Pecan Culture," Prof. Craig of Cornell, which you recently published prompts me to make some remarks on the subject of local interest.

The idea has been that the pecan was at least a doubtful crop in California because of the experience of some that certain trees planted many years ago either bore no fruit or fruit (nuts) of poor quality. It may be remembered that this was the same with the walnut until some growers in Santa Barbara and Los Angeles succeeded in producing strings of prolific and hardy strains.

I have observed the pecan growing closely of late, in various parts, between Butte county and Tulare. At Oroville are large pecan trees, many of them bearing full, regular crops of nuts of very superior quality and I find the same through the Sacramento Valley, in Solano county, through the San Joaquin Valley far as Grangeville, Tulare county. I doubt they would be equally successful anywhere in the warm, interior valleys, and through Southern California. The trees grow well near the coast, and, as a street or tree are unsurpassed, being of symmetrical, upright growth, and clear, bright foliage, but a warmer climate is needed to mature the nuts.

The pecan already rivals the walnut, and government experts on foreign markets express the opinion that it may supercede it. At any rate, we can grow pecans as successfully in California as in Georgia, Florida or Texas, we might as well be in the swim.

While there are a large number of improved, named varieties—selected seedlings originally, and grafted therefrom—it is also a fact that really prolific, soft-shell nuts will produce in kind to a very considerable extent. It is then, to plant such seedlings in orchard form; any trees that did not produce the best nuts could in time be grafted over. At present we have not the grafts, but nursery men should be raising a stock for future demand.—LEONARD COATE, Morganhill, Santa Clara county.

I.H.C. IRRIGATING ENGINES

If the Water is Lower Than Your Land an I.H.C. Gasoline Engine Will Solve the Problem.

THAT is often the problem with irrigators—the water is lower than the head of the ditch.

The old way of doing was to construct the ditch up stream (often several miles) and head it high enough so that the water would flow down upon the land. If the only available water was a lake or pond below the land, irrigation was usually abandoned, because it was thought that the water could not be pumped up in sufficient quantities, or the pumping operation would be too expensive.

Irrigators know better these days. They are now placing I. H. C. gasoline engines on the banks of these low lying lakes and converting the waters to a beneficial use on their thirsty lands.

They no longer find it necessary to build miles of extra ditch to get fall enough to reach the lands. An I. H. C. engine will take the water from the stream where it flows through or near the farm, and raise it any reasonable height.

Irrigation problems are solved with the I. H. C. engines, because they have three main characteristics that adapt them to the work:

First—They pump water in unlimited quantities.
Second—They raise water at a low cost.
Third—They make a near approach to self operation. When set going they run for long intervals, regularly and dependably, with the least possible attention. The result is that I. H. C. gasoline engines are completely changing irrigating methods. Fertile but dry uplands are being brought under cultivation where a few years ago that was thought to be impossible.

Have you a dry farm on your hands?

Or do you know of a fine piece of land you would like to homestead if you could get some "unappropriated" water for it?

There is no reason why you should abandon your project. There's always near at hand a low lying lake or a slough or an underflow or a well or a stream down at the foot of the bluff. Find anyone of these, and an I. H. C. engine will put the water where you want it.

The engines are made in various styles, Vertical, Horizontal—Portable and Stationary. They range from 2 to 20-Horse Power.

Look into the matter and see which one of these irrigating powers will do for you. The local International agent will be glad to talk over your particular case, furnishing catalog and giving engine particulars. Or if you prefer, write nearest branch house for catalog.

The Vegetable Garden

THIS MONTH.

MANY varieties of vegetable seed may be sown this month.

Plant out cabbage and cauliflower plants which were sown in July. Plant a good bed of Earliana or Richmond tomatoes for winter crop. Also beets, Swiss Chard, spinach, etc. Plant largely of peas (Yorkshire Hero is the favorite). These will be ready about holidays, when price is high. Canadian Wonder, French Kidney or Ventura Wonder beans will also produce till the holidays if planted now.

Keep the compost heap wet and turn occasionally. Weeds in a compost heap are far better than in the corners affording breeding places for all kinds of worms and pests.

THE FRUITING OF CUCUMBERS.

Not a few people are puzzled by the behavior of cucumber vines in the gardens and complain that although the vines are blossoming full, little or no fruit sets. A number of inquiries of this nature have already been received at the Colorado Agricultural College Experiment Station this year.

The reason for this is as follows: There are two kinds of blossoms upon the cucumber vines, as well as upon a number of other plants of similar nature. The first blossoms to set, and by far the most numerous throughout the life of the plant, are what are known as male flowers. These are imperfect in their makeup, for the reason that they lack the pistil, or that part from which the fruit and seed are formed, but it bears an abundance of pollen which is necessary to the development of the pistil of the pistillate flowers.

The other, or pistillate flowers, sometimes called the female blossoms, are produced later in the season and are also imperfect, for the reason that they usually lack stamens, but are provided with a pistil. The pistillate flowers can readily be told, because there is a miniature cucumber at its base, even before the bud has opened.

Now, in order to produce fruit, it is necessary for pollen from the staminate blossoms to be transferred to the pistil of the other class of flowers. When grown in the green house, the work of pollination must be done by hand, but out of doors, there are always insect visitors enough to perform this important work. In fact, this is one of nature's provisions by which cross-fertilization of plants is effected. Insects of many and various kinds visit from blossom to blossom and as they go to the staminate flowers their bodies become dusted with the pollen; then as they chance to visit a pistillate flower, some of the pollen is bound to be left upon the receptive surface of the pistil. This in plants is known as pollination.

The pollen grains have the power of germination much like a grain of corn. The end of the pistil is moist so that the grains soon germinate and the germ tube finds its way down through the pistil to the immature seeds which it enters and gives up a portion of its protoplasm. This process is known as fertilization.

As a rule it may be stated that no fruit of any kind can be produced without this process of pollination and fertilization. Fertilization incites the immature seeds into growth and this, of course, causes the parts which surround them, as in the case of cucumbers, to grow, and the re-

sult is what we call the matured fruit, which in this case is not strictly correct.

Certain conditions which are not well understood seem to keep the plant producing staminate blossoms at the expense of early fruit production. But in a general way, we cannot materially hasten the formation of pistillate blossoms. We should see to it, therefore, that the plants are kept in a vigorous growing condition by planting them, first of all, in good garden soil, and seeing that they are supplied with an abundance of moisture at all times.—W. PADDOCK.

PARCELS POST.

Writing from Nice, Vice-Consul A. Piatti, states that he considers it important to indicate that the establishment of a parcels post, such as exists between France and Great Britain, would be a very important factor in the creation of trade. He continues:

It would facilitate to a marked extent the sending of samples of many goods that would find an opening in this market, to say nothing of the creation of a semi-retail trade, such as now exists between France and Great Britain, and which certainly amounts to a very considerable sum per annum. Taking into consideration our American activity in advertising, the variety of our manufacturers, and the keen competition existing among our manufacturers, I venture to predict that this branch of trade would, in a very few years, outstrip that done with the United Kingdom.

BACTERIA AND MANURES.

A Russian scientists has been working on the action of ferments in stable manure and has found that while they liberate considerable ammonia, manures that have been sterilized lose much more through the process of sterilization. In ordinary practice, this is not done, but in certain work, seed bed work for instance, it is sometimes desirable to heat the soil and manure to kill the seeds and fungus spores. This drives off about one-third of the ammonia contained in the manure.

INFLUENCE OF FERTILIZERS ON TUBERCLES.

It is found that there was a great difference in the development of root tubercles on legumes when different food ingredients are supplied. Potash and lime salts promoted the growth of the tubercles and in the absence of magnesium, none were formed. On the other hand, when potassium nitrate was present in quantity greater than 1 to 10,000, no tubercles were formed. The experiments were made in water cultures so that every part of the experiment was under control.

The legislature of Wisconsin has appropriated ten thousand dollars for the purchase of land at tax sales. Whatever land any county becomes possessed of from non-payment of taxes must be offered to the Public Land Commissioner before it can be sold to anybody else. The land so purchased is to be added to the State Forest Reserves. In this way the State can gradually recover land which it has carelessly permitted to pass into private hands and be despoiled of its wealth of timber. If the State had held these timber lands from the beginning it would have been immensely better off. It is to be hoped that these dismantled lands will be reforested and that therefore, something may yet be saved out of the wreck.

Lost Strayed or Stolen—One Cow

That is about what happens each year for the man who owns five cows and does not use a Tubular cream separator. He loses in cream more than the price of a good cow. The more cows he owns the greater the loss. This is a fact on which Agricultural Colleges, Dairy Experts and the best Dairymen all agree, and so do you if you use a Tubular. If not, it's high time you

did. You can't afford to lose the price of one or more cows each year—there's no reason why you should. Get a Tubular and get more and better cream out of the milk; save time and labor and have warm sweet skimmed milk for the calves. Don't buy some cheap rattle-trap thing called a separator; that won't do any good. You need a real skimmer that does perfect work, skims clean, thick or thin, hot or cold; runs easy; simple in construction; easily understood. That's the Tubular and there is but one Tubular, the Sharples Tubular. Don't you want our little book "Business Dairymen," and our Catalog A. 280 both free? A postal will bring them.

FILLING THE SILO WITH ALFALFA.

THE placing of the men and teams for this work will depend on the number of men employed and the number of wagons, as well as the haul to the silo. It works out better to have extra capacity in the cutter and engine, than to be over-flush with men and horses in the field. It is easy to shut down the engine for a half, or quarter day while the teams catch up with their work. The alfalfa silage is better when filled in slower than when rushed in too fast. When I have filled in twenty feet of silage in two days, I have not had as good ensilage as when I was four or five days having the same amount of silo filled. The slower filling gives time for even heating of contents rather than an over-heating of the lower portions of the silage.

At Work.

Start to cut the alfalfa on Monday afternoon, raking it into windrows first, and then into cocks. On Tuesday morning begin to haul to the silo. The mowers are kept half a day in advance of the hauling in. The rakes follow the mowers right along. The reason for not hauling in at once is that the alfalfa wilts, this softens the main stems and when they are cut up they are soft and pack readily to place in the silo. It is the same in packing grapes for the market; if the stems are not wilted the baskets arrive only half full at the end of the journey. To every four teams hauling, allow one extra man to help load in the field.

Loading.

We load by hand from the cocks as the hayloaders are thrown off by the checks in the alfalfa field. Sheets are used on the wagons, two usually. The first one is placed on the wagon, the hay forked on it and then when it has about half the carrying capacity of the wagon, a second sheet is spread over the hay and another lot placed on it. These sheets are home made and are usually good for a couple of years service. Take the widest unbleached muslin in the market and sew two widths together, making a sheet two feet larger all around than the wagon bed. Double stitch the seams and take a rope, (we use window cord) sew it into a seam along the edges. At each corner and half way between, thread on the rope four-inch iron rings, sew them firmly to place. At the cutter a derrick pole with block and tackle lifts off the hay by having a rope run through the rings to lift up the mass and swing in down beside the machine, letting loose of the rope in the rings on one side promptly empties the sheets of the hay.

Tramper and Cutter.

The two men, one that tramps in the silo, the other—that cuts—take turn about hourly, as well as the man that forks the hay over to the cutter. Now if a gasoline engine is used this man can be used to see that it keeps going and does not have the belts slipping. The blowers to raise the alfalfa or corn into the silo are used almost altogether. Yet there are several makes that fail on alfalfa. My neighbors at Medera bought a blower for alfalfa silage. Fortunately with a written guarantee that it would work. When it did not, he had some re-

dress. Otherwise he would have today a useless piece of machinery on hand. The traveling tables also rarely work well on alfalfa; this should be purchased with a written guarantee. The first silage I made was naturally corn; on this food stuff the traveling table did fine work; two years later the same table proved useless on alfalfa.

Water.

Now in Fresno, we find that we have sweeter and lighter colored alfalfa silage when we use plenty of water. The early cutting may have dew on it, then we do not use water, but in the summer cuttings the water is essential as it fills every spot. When there are no air spaces the silage is good; if there are spaces that are dry then a white mold appears that is intensely bitter to taste, that the cows dislike extremely. We often mix in wheat or barley straw with green alfalfa, one load to six or seven; while this may seem like weakening the feeding value of the ensilage yet the cows relish it and there is no dropping in the milk yield.

Heating.

With us alfalfa heats hotter than corn in the silo. We usually fill the silo half full, level it off and then lay off the men until the ensilage cools down to a hundred and ten degrees. This temperature is taken two feet below the surface. The silage if tramped should not settle over three feet in depth of fifteen; by chalking a line around the silo this can be tested and if it settles more than that, have the tramping more carefully looked after. The placing of the men each morning will depend on the number of wagons at work and the length of the haul. When there is not a large amount of alfalfa stacked at the machine to start the morning's work, then it is well to send out all the men to the field the first thing and hustle the loads on the wagons; let the second wagon in take the cutter, engineer and tramper, and let them then get to work. A silo crew must be started off with a good swing in the morning if there is to be good work done. The slow, lazy start is a mistake. It is better to make men start at something promptly even if it is not of much account, than to have them loiter.

Keep Going.

If at any time the field crew falls behind, send the men from the cutter to help them out, shutting down the engine for the time. The secret of success in handling men is to move; good men want leadership not someone crawling after them. Pushing the work along by leading is better than by scolding at the poorness of labor. Men like to work where something is finished each day, where they see the work they have done grow under their hands. The crew we work with on a short haul are divided as follows: Engineer, feedman at cutter, man inside the silo, one helper at cutter, two mowers, who also do the raking, four teamsters that haul and load, one extra man in the field to help load. This force in the field can be doubled by putting on an extra man to load and one for continuous raking, eight wagons can be kept going all the while.

Filling a Silo.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

SORE SHOULDERS

I would like very much to personally meet reader of this paper who owns any horses that sore shoulders and tell him about Security Salve. This is impossible so I am going to tell through the paper.

You and I both know that horses working sore shoulders are in pain, and that they can do much work without running down as when are free from pain. I also know perfectly well Security Gail Salve will cure these shoulders if you do not know it. If you did you would have your dealer at once and cure them up. I have no doubt often wished that you knew something you could rely on. You can rely on Security Gail Salve. It will do its work even if you prefer to try it first. I will mail a sample can free. Just write for it—it will go on first mail.

Also I want to tell you that Security Anti-Healer is as good for barb wire cuts as Security Gail Salve is for harness galls. Dealers carry in 25c, 50c and \$1.00 sizes. Use them for your guarantee your perfect satisfaction.
